

# AltiKa data over Lake Baikal

A. Kouraev,  
E. Zakharova,  
F.Rémy

Atelier altimetry and glaciology  
Toulouse, 26 June 2014

# Deepest lake in the world

(max 1637m, average - 731 m)

# Lake Baikal

20% of world freshwater resources (23015 km<sup>3</sup>)

Three main parts, specific limnological regime and currents

## SOUTHERN BAIKAL

Max depth - 1461 m

1000 m

## MIDDLE BAIKAL

SELENGA SILL

Max depth - 1642 m

1500 m

1000 m

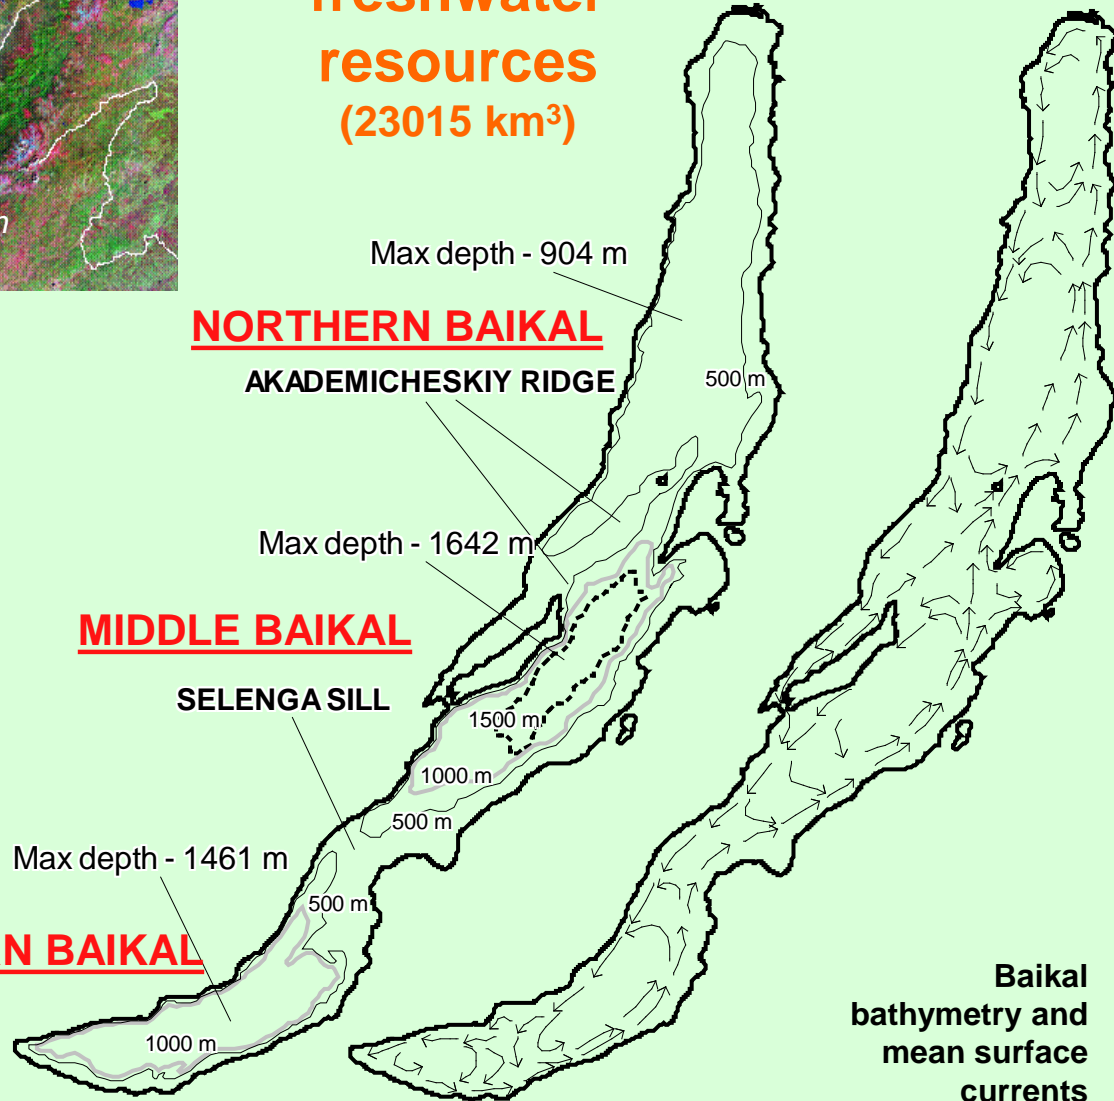

500 m

## NORTHERN BAIKAL

AKADEMICHESKIY RIDGE

Max depth - 904 m

500 m

Baikal bathymetry and mean surface currents

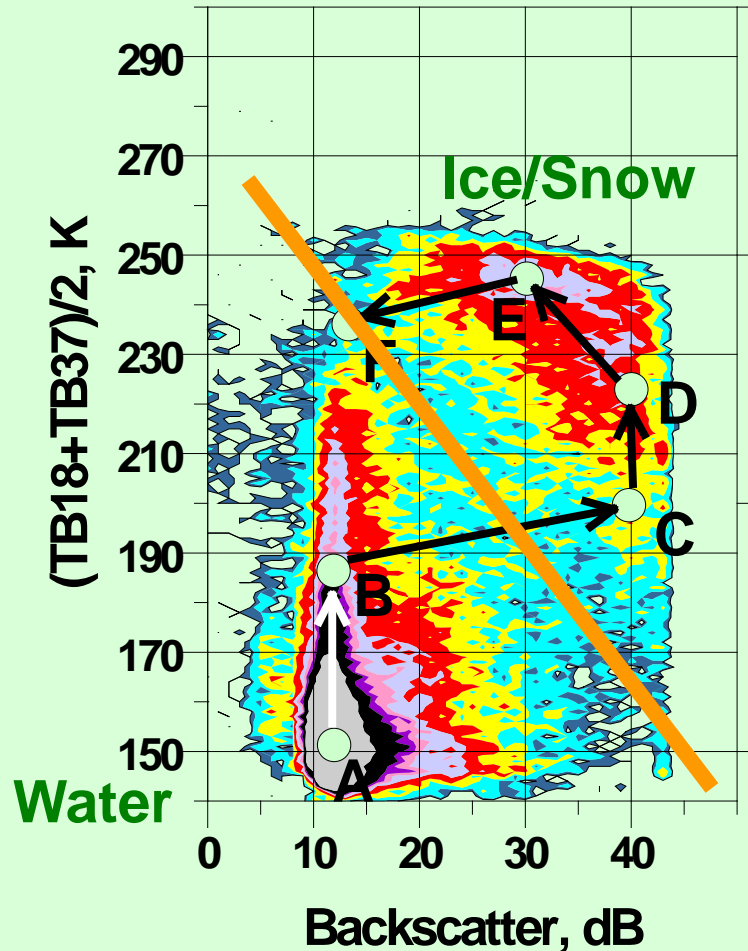

# Altimetric coverage

# Altimetry method

a) Caspian and Aral seas

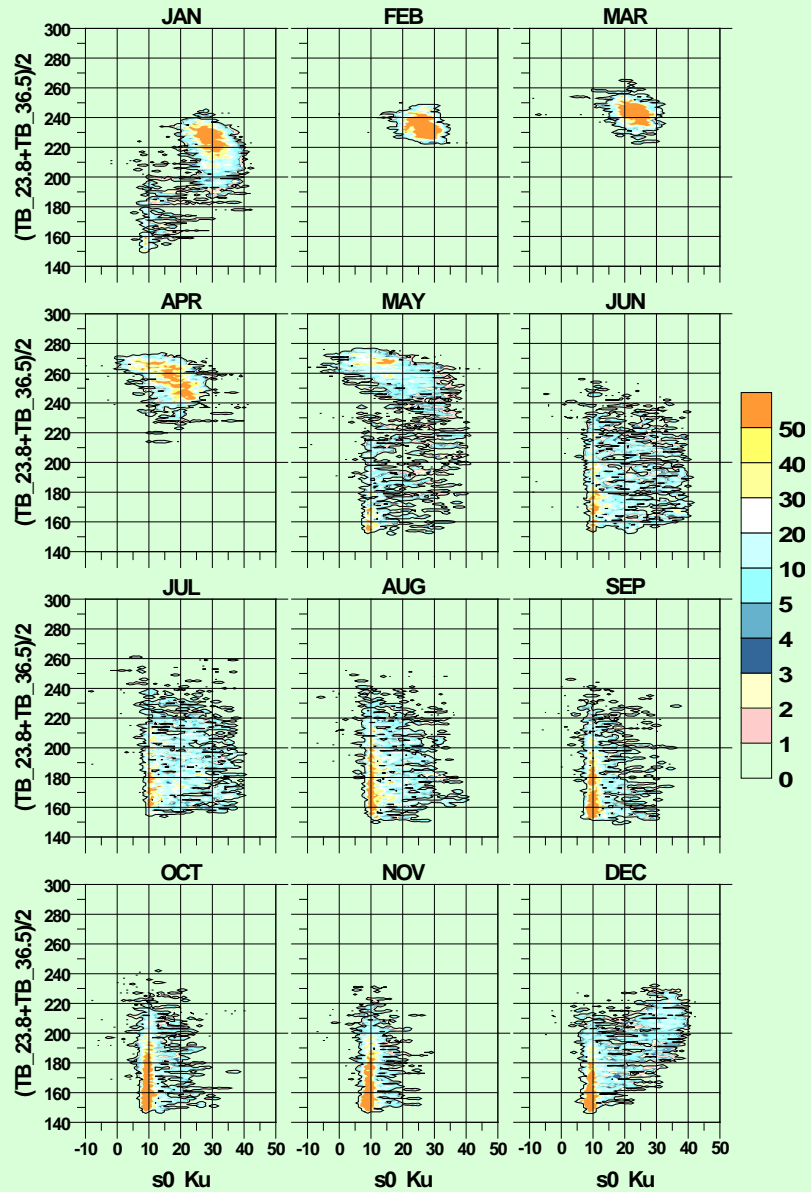

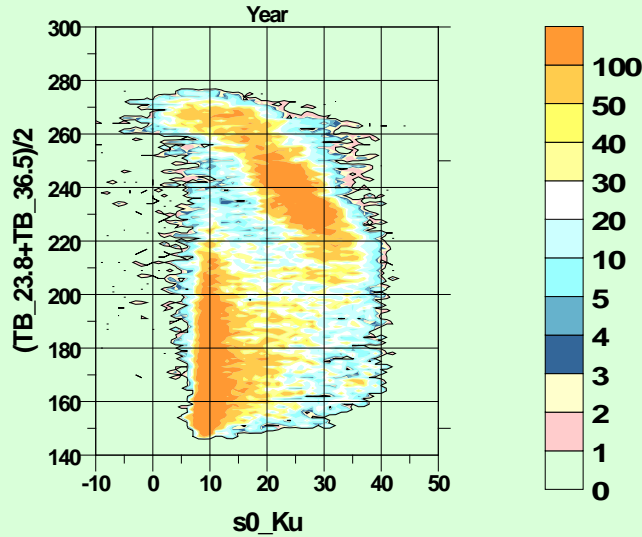

b) Baikal, Ladoga and Onega lakes

*Schematic representation of the temporal evolution of T/P observations in the space of backscatter vs. TB/2. Schema is overlaid on two-dimensional histograms (total summed values) for Caspian and Aral seas (a) and Baikal, Ladoga and Onega Lakes (b)*

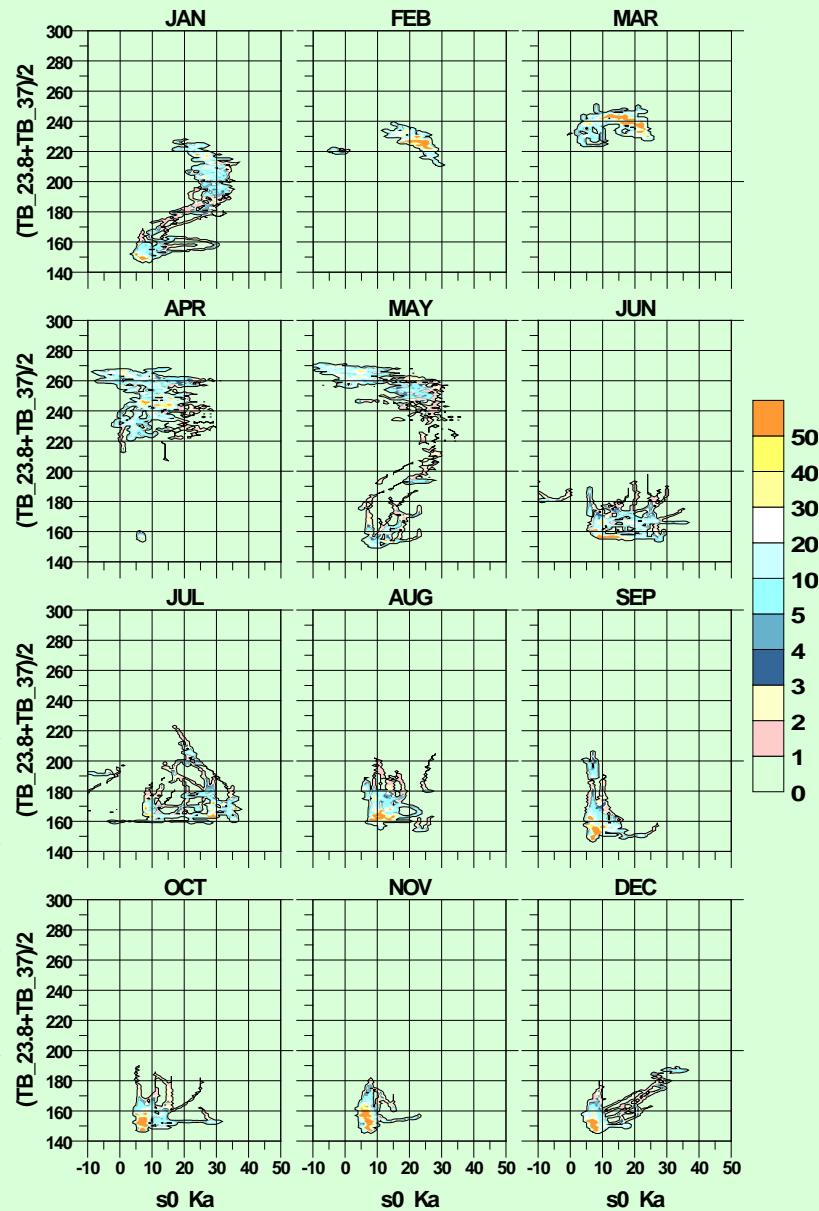

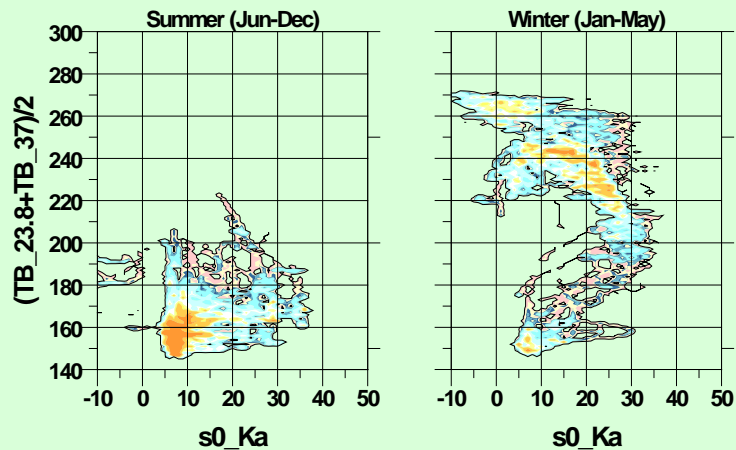

# Lake Baikal - ENVISAT

LAKE BAIKAL: 2D histograms  
(number of observations), ENVISAT data, Ice2

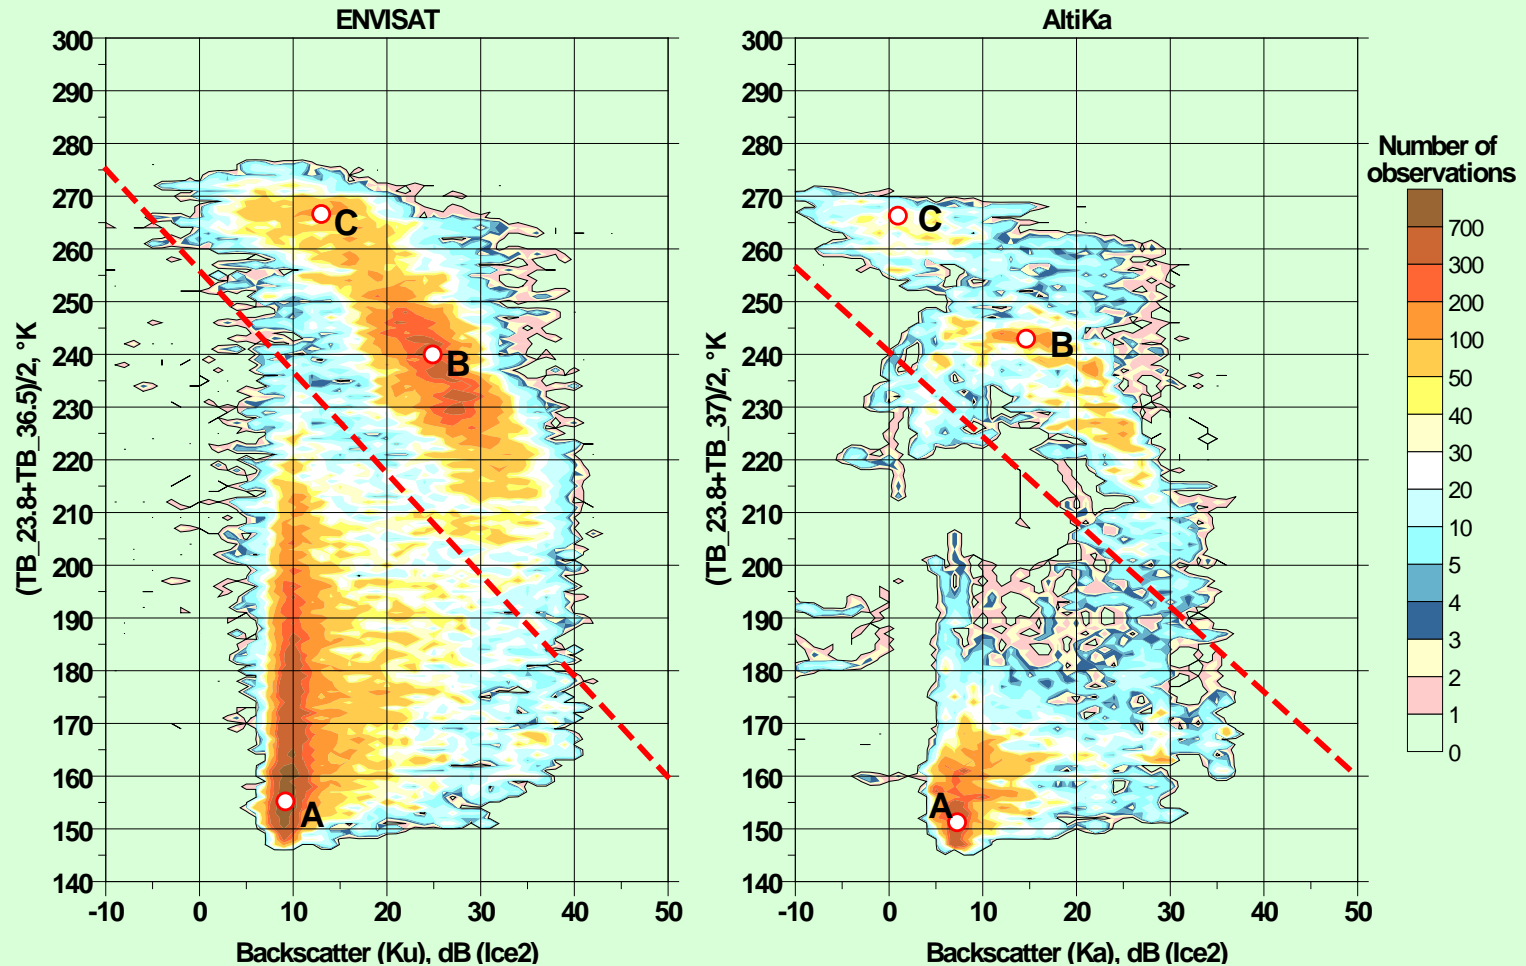

# Lake Baikal - Altika

LAKE BAIKAL: 2D histograms  
(number of observations), Altika data, Ice2

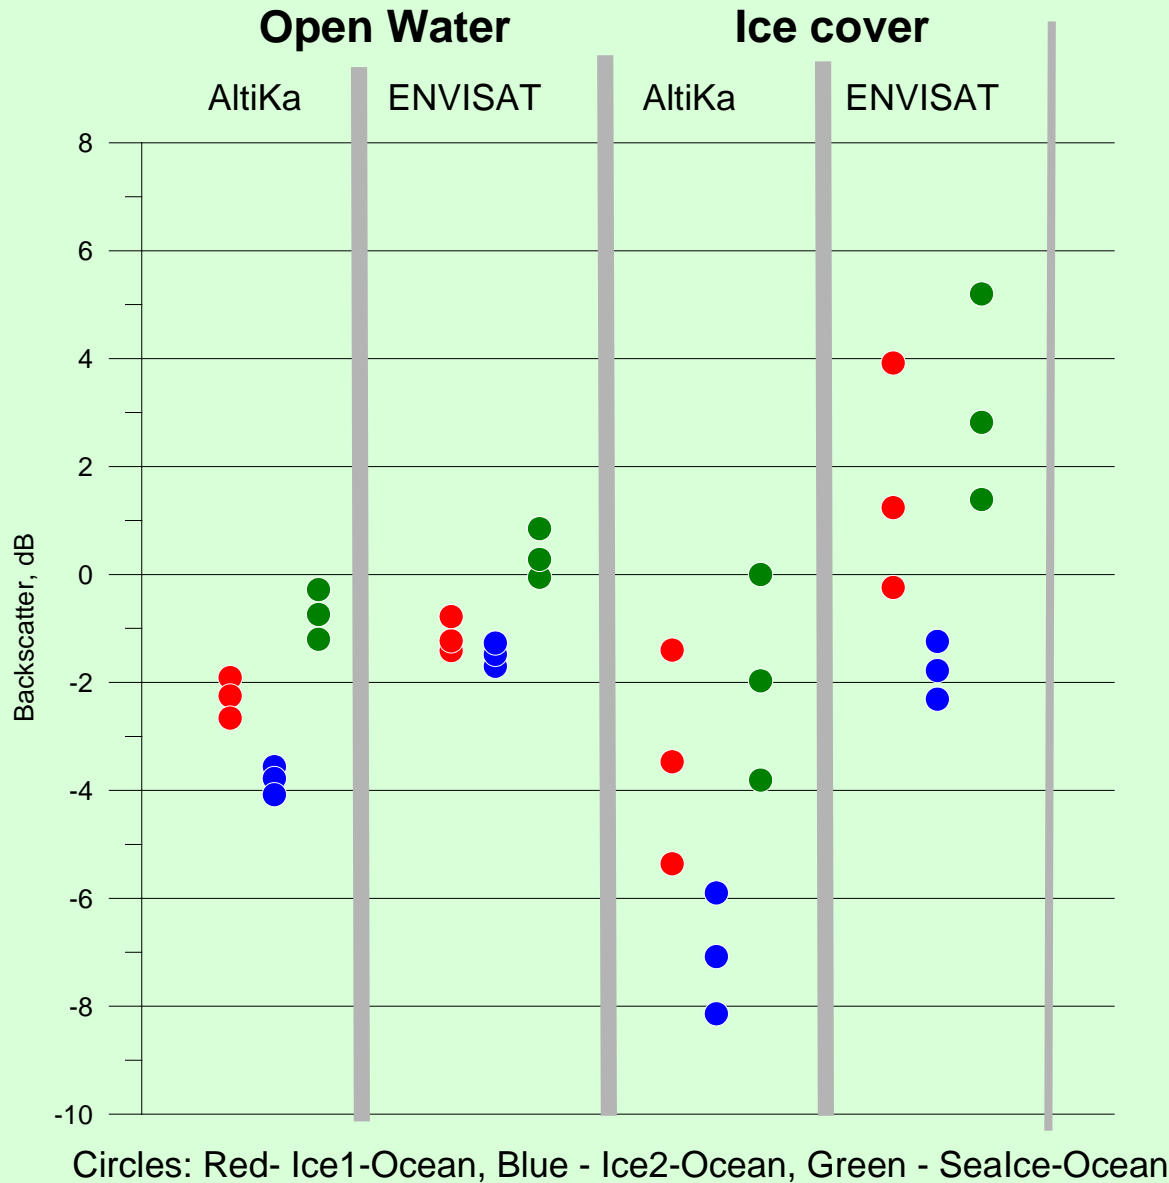

# AltiKa vs ENVISAT

**A (open water): smaller sigma, TB is more centered**  
**B (ice): smaller sigma, slightly higher TB**  
**C (old ice, snow): smaller sigma**

# Statistics of Sigma from 4 retrackerers

Reference: values from Ocean retracker, 1Q, Median and 3Q

Decrease of Ice1, Ice2 and Sealce in AltiKa

More spread for ice cover than for water (heterogeneity)

Ice2 ice cover - more spread for AltiKa (better sensitivity for difference surface types?)

## Open water

## Ice

# Influence of ice on altimetric range estimation

**Aral Sea: ice conditions**

**ENVISAT retracker: Ocean, Ice1, Ice2, Sea Ice**

**Ocean retracker: too high when ice is present**

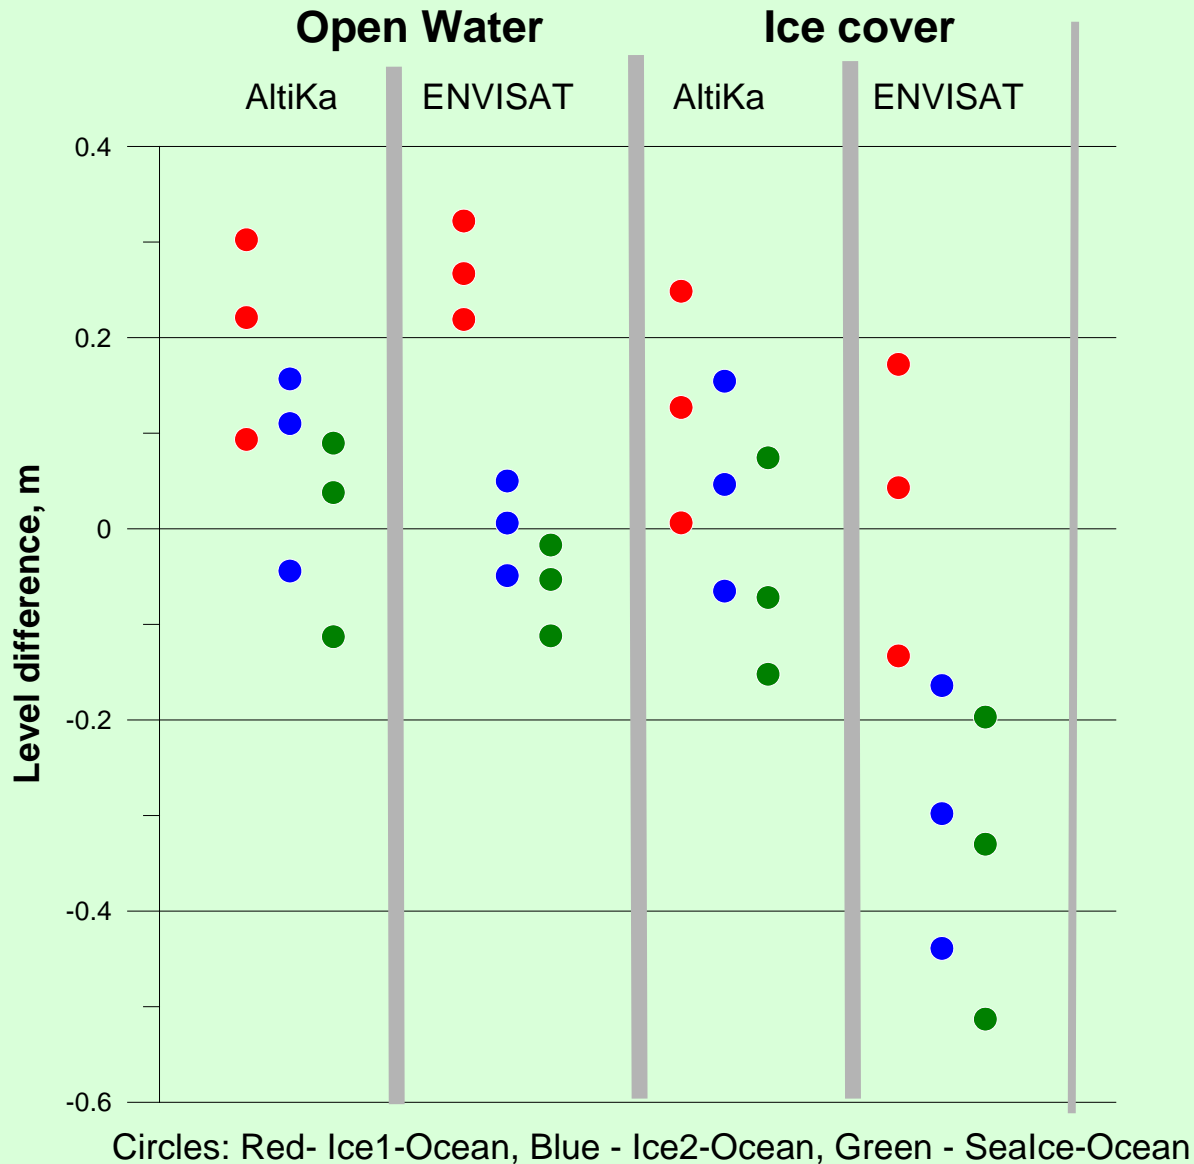

**Correction (40-45 cm) for Ocean retracker**

**Important for T/P, Jason-1, GFO time series (Hydroweb etc)**

*Position of sea level (cm) for Ice1, Ice2 and Sea Ice retracker relative to Ocean retracker for open water and ice cover conditions. Black points - median values, lower and upper limits of boxes correspond to 1st and 3rd quartiles*

# Statistics of level from 4 retrackerers

Reference: values from Ocean retracker, 1Q, Median and 3Q

Open water: more spread for AltiKa (1 vs 8 years?)

More spread for ice cover than for water (heterogeneity)

Ice cover: less spread for AltiKa, and less bias for Ice2 and Sealce (MLE4 vs Ocean?)

# SARAL/AltiKa

Ku-band 13.575 GHz=**2.2 cm**

2.32cm

Ka-band 35.75 GHz=**0.84 cm**

1.624 cm

**New frequency, new phenomena  
less penetration, better spatial resolution**

**How does ice structure influence altimetric signal?**

**LEGOS-GBT-  
LEAD Int.  
expeditions  
2010-2013**

**2010**  
**2011**  
**2012**  
**2013**

**Launch 25 Feb,  
data since  
13 March 2013**

**30 Mar 13**

**In situ 2-4 Apr 13**

**4 Apr 13**

Smooth, mostly clear ice

Rough, hummocky (1 cm thick), snow

Smooth; congelated pancake ice

Snow, small patches of clear ice

Snow-covered ice

Snow, small patches of clear ice

Double-layered ice

# Backscatter changes in spring 2013

AltiKa track 466, Lake Baikal, cycles 1 and 2

**Decrease of 15-20 dB, different spatial structure  
Ice1 much noisier for old ice**

# Backscatter changes in spring 2014

AltiKa track 466, Lake Baikal, cycles 11 and 12

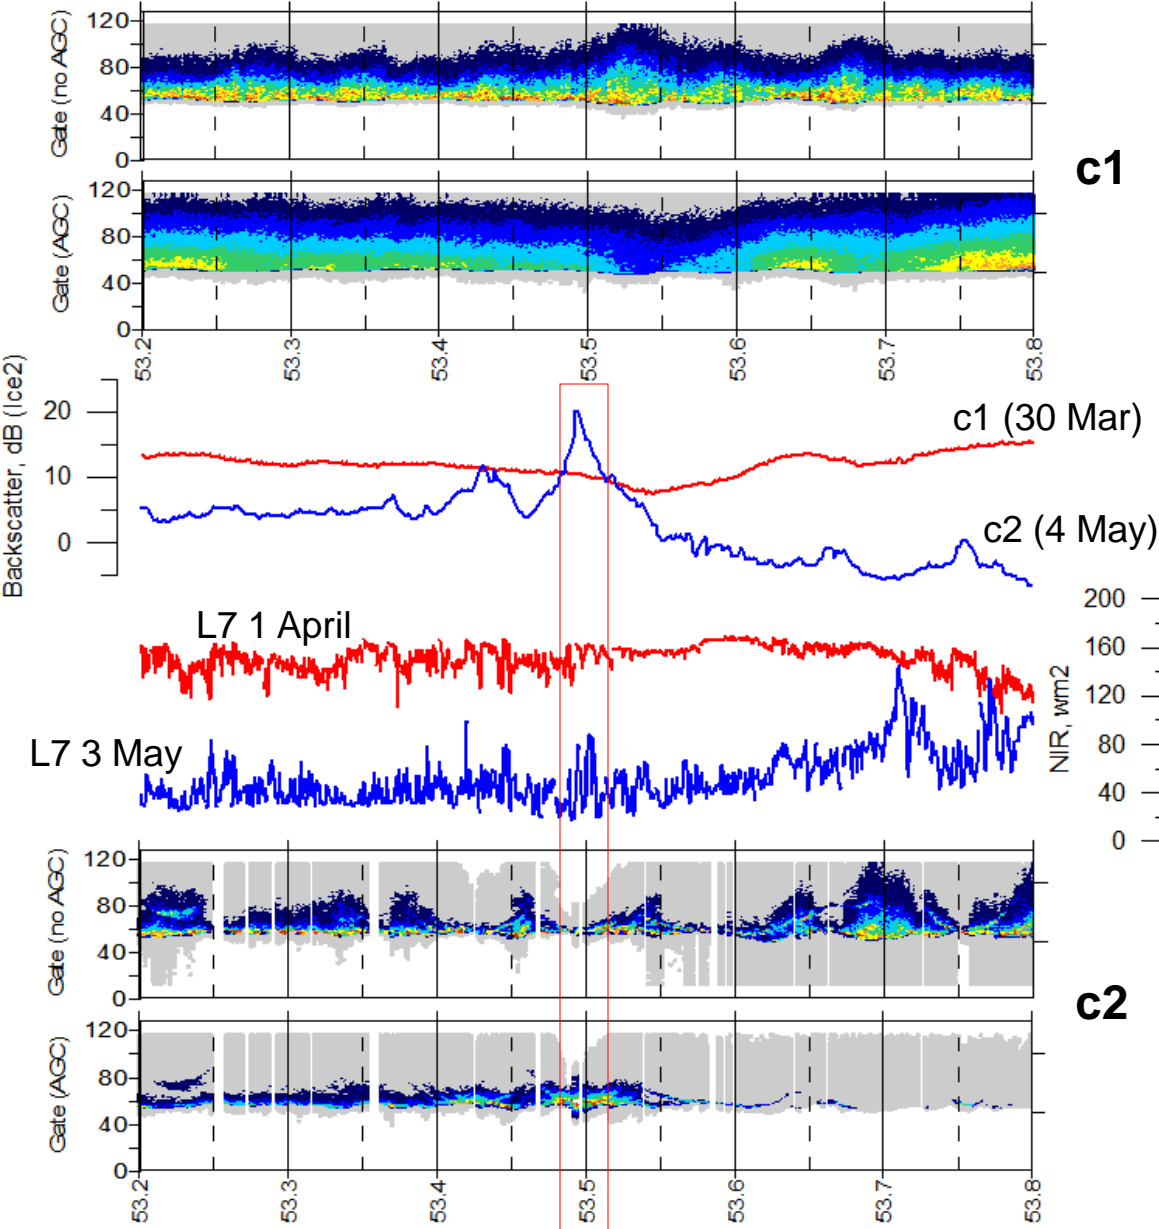

**Decrease of up to 25 dB, different spatial structure  
Ice1 much noisier for old ice**

# Landsat 7, 1 Apr and 3 May 2013, NIR

Some clouds present

Decrease in backscatter,  
decrease in NIR range

Dark ice (southern  
part of 3 May image) -  
stronger backscatter,  
peak on frozen lead  
(ice is also thinner)

In situ (3-4 Apr)

Snow  
max,  
cm

4

0

Latitude, °N

**Going down to  
micro scale**

# Air channels

**Air channels formation in 9 min**  
**Influence on albedo and waveform**

**Air channels and bubbles**

**Needle ice on surface (3 cm)**

**Relation between ice structure and altimetric signal**

**Needle ice on below (12 cm)**

**Ice crust hanging in the air**
