

# CryoSat Mission

Overview of data quality status, evolutions and SAR acquisitions over Antarctica

**Jerome Bouffard\***

CryoSat Mission Geophysicist

*\*With inputs from Tommaso Parrinello and Pierre Femenias*

# Table of content

- Context
- Product Evolutions
- SAR acquisitions over Interior Land Ice
- Conclusions and Perspectives

- **CryoSat Mission Main Challenges**

Need to quantify how the thickness of the ice is changing to understand...

**... how Global changes are affecting polar regions and ...**

**... how polar regions are affecting by the Global Changes**

Dev. of sensor  
concept and  
IPF

Improve the data  
quality and  
availability

Achieve  
mission  
objectives

*Arctic sea ice thickness  
Antarctic & Greenland ice  
sheet mass balance ...*

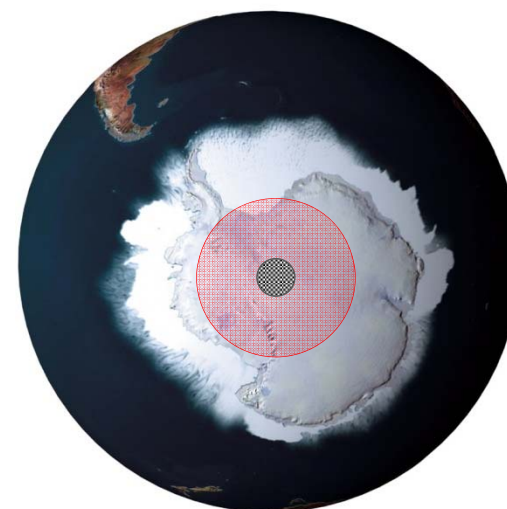

***ESA and Partners***

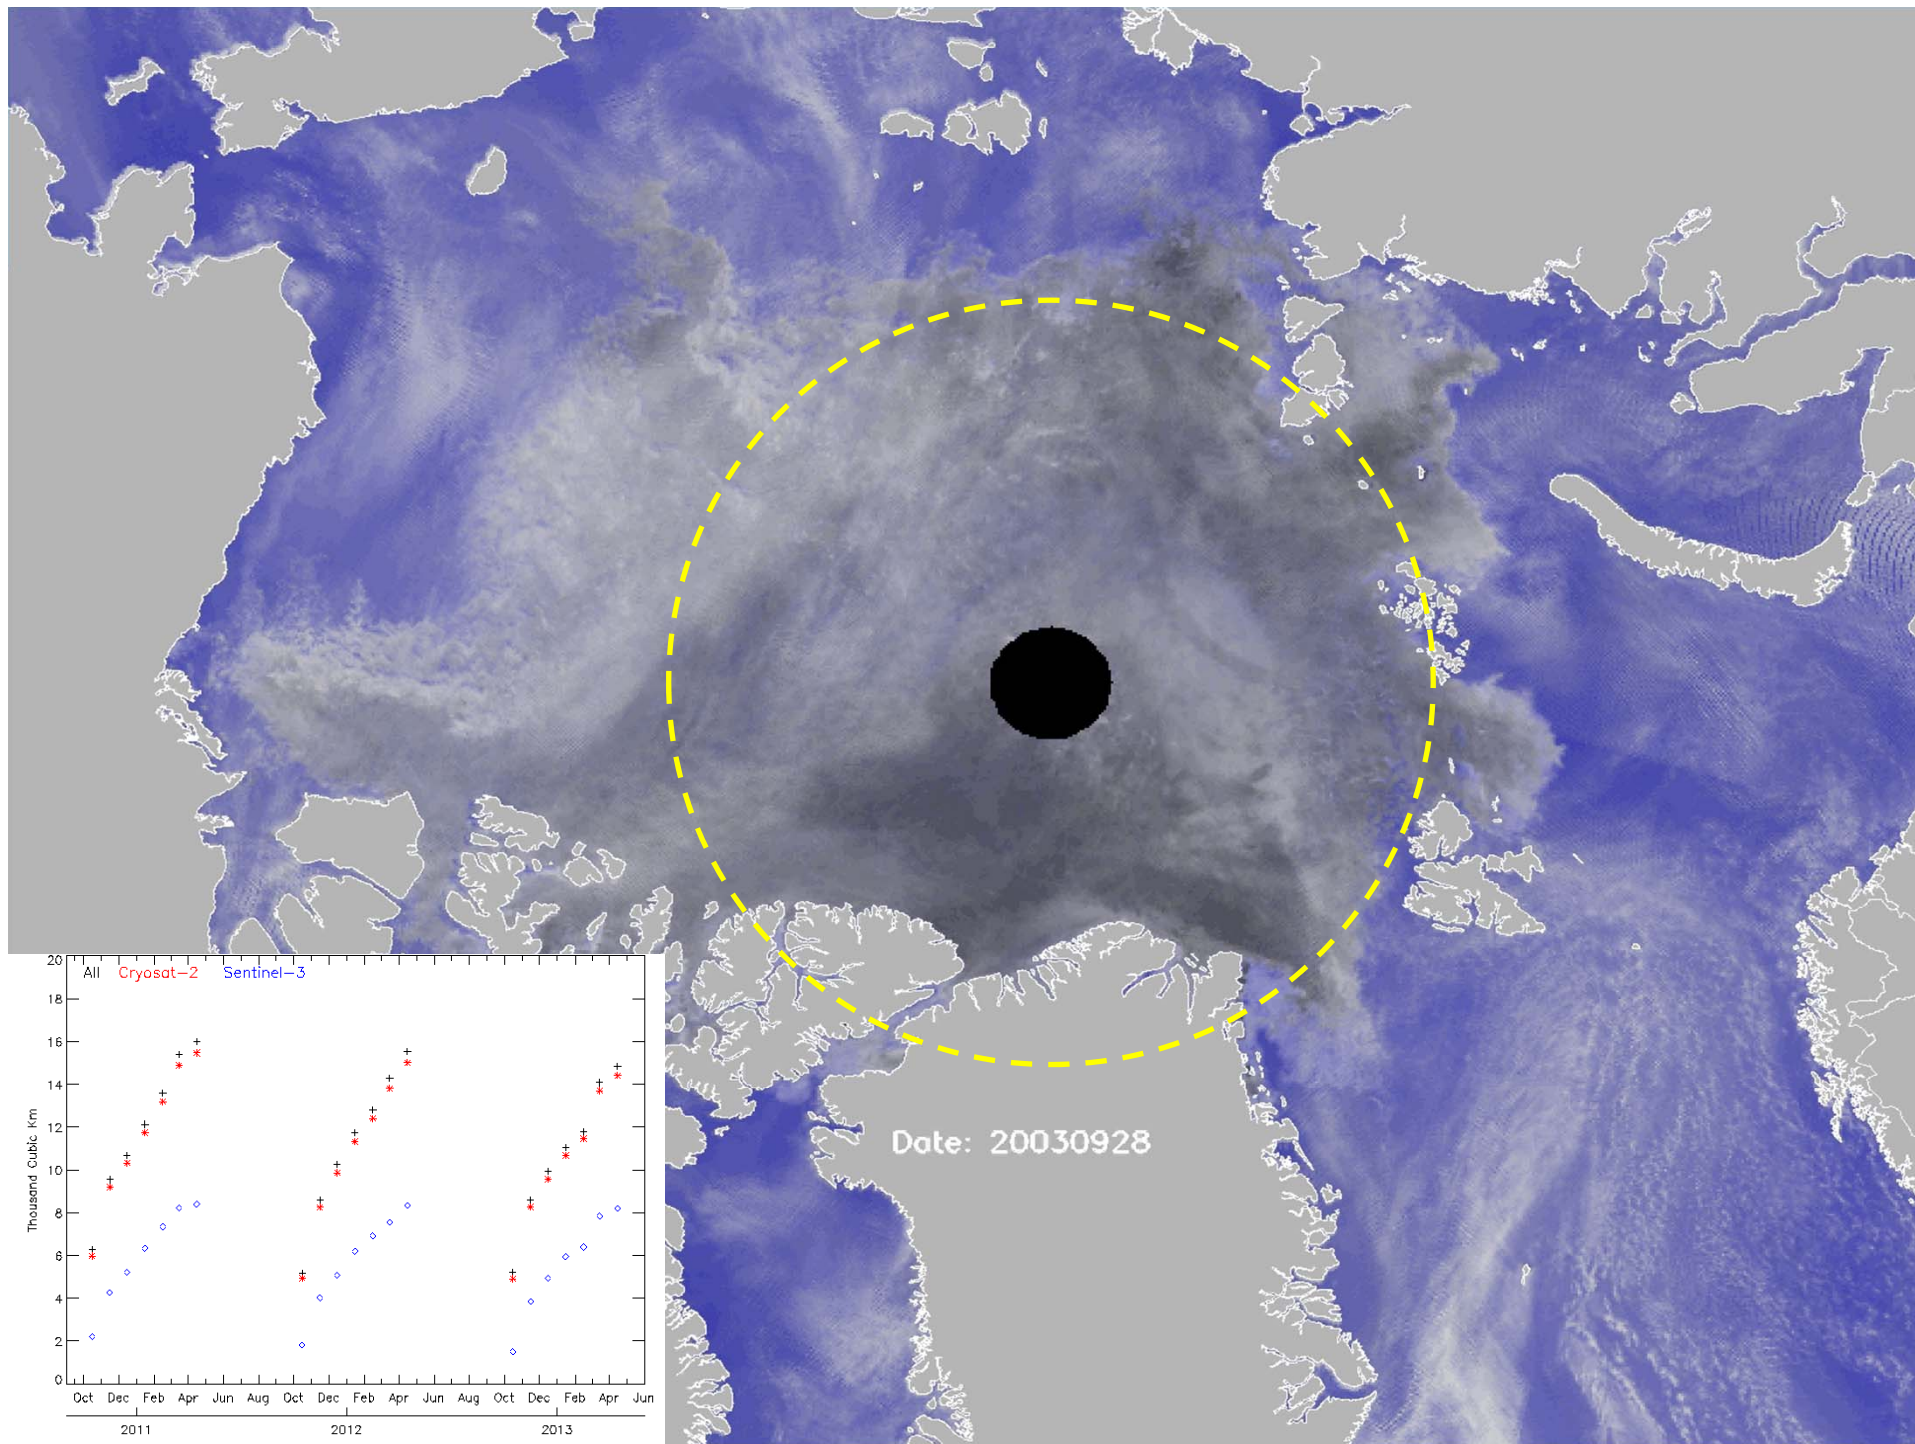

- **An unusual Orbit**

92 degree orbit inclination to survey Arctic Sea Ice & Antarctic and Greenland ice sheets.

369 day repeat with 30 day sub cycle provides dense across track sampling and captures temporal change

- **Finer Spatial Resolution**

SAR mode improves along track resolution, designed to pick out leads

SARIn mode improves across track resolution, designed for rugged terrain

- **CryoSat Mission Main Challenges**

Need to quantify how the thickness of the ice is changing to understand...

**... how Global changes are affecting polar regions and ...**

**... how polar regions are affecting by the Global Changes**

sheet mass balance ...*

## **ESA and Partners**

Raise new  
challenges

*Near Real Time products*

Imagine new  
applications

*Oceanography,  
Hydrology, Geodesy*

## Wider scientific achievements beyond ice

# Context

- Beyond ice: *Ocean Dynamics*

Extends capability to  
polar oceans, small  
basins, and coastal  
regions

Allows tracking of dynamic  
ocean topography in presence  
of sea ice

Additional  
source of sea  
level data

R. Scharoo, Eumetsat

- **Beyond ice:** *Marine Gravity and Wetlands*

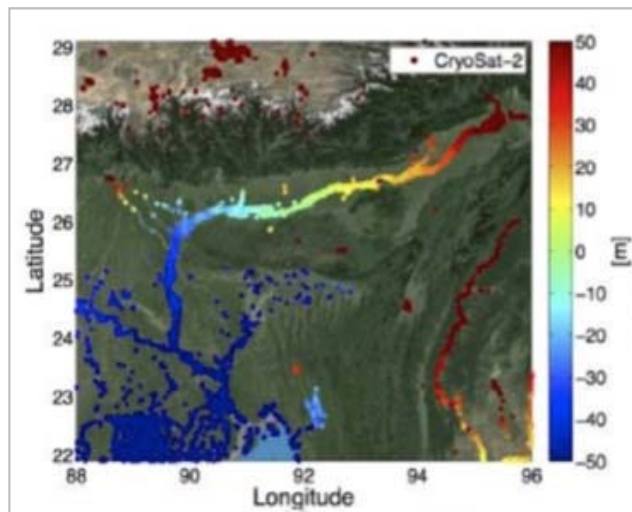

## Marine Gravity

CS2 range precision >2 times ERS

SIRAL can detect seafloor characteristics at 5-10 km scale

D. Sandwell, Scripps

## Inland water

Mapping of inland water storage

CS2 only mission sampling high Arctic rivers and lakes

Credits: FFI-LOTUS

# Product Evolutions

- Operational Polar Monitoring

Sea-ice thickness: 2 days, 14 days, 28 days

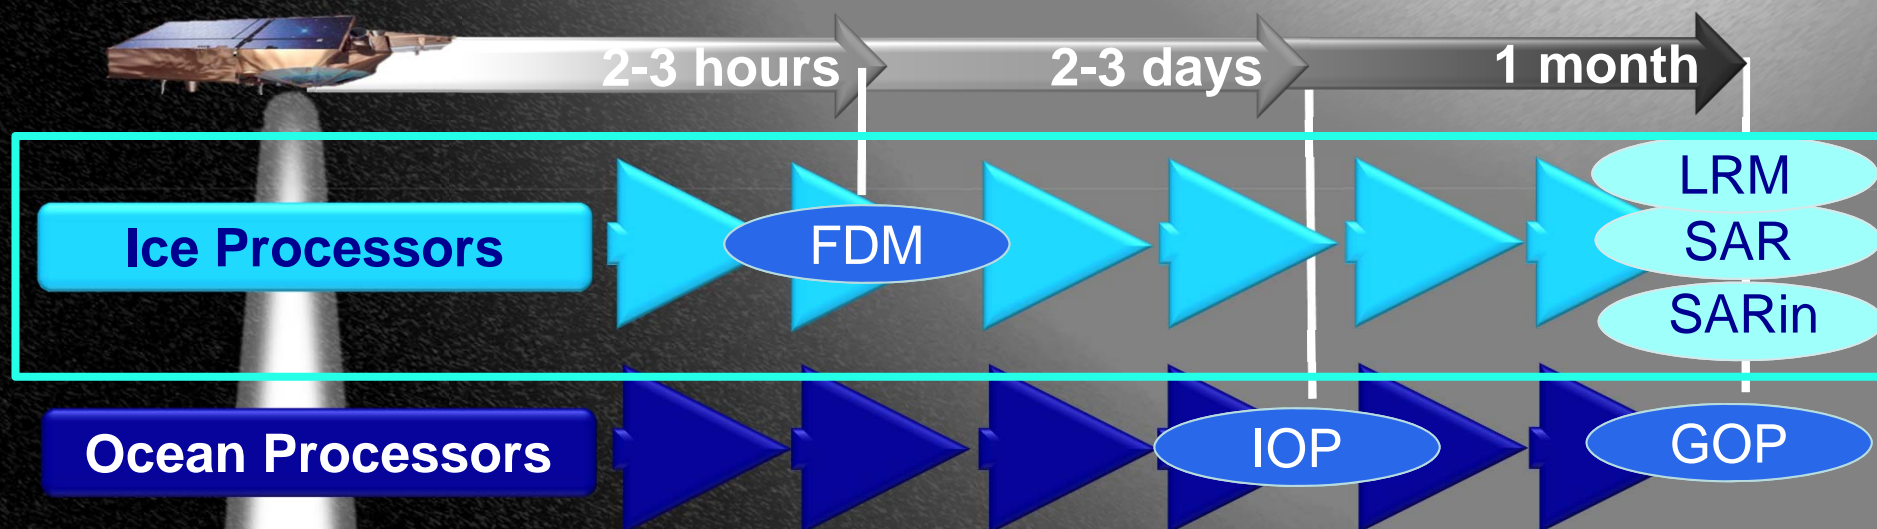

<http://www.cpom.ucl.ac.uk/csopr/>

# Product Evolutions

- **2 CryoSat Processors**

Ocean products distributed in order to bridge the gap between previous & future ocean-oriented missions

**Ice IPFs:** L1B & L2 ice products are distributed in order to achieve the Mission objectives over the cryosphere

**Only the ice products are generated with the Baseline C**

- **Baseline C: A Major Processor Upgrade**

- Processor upgrades to improve the CS2 products **quality and Content**

- Fix issues from previous release, **refine IPF1/IPF2 algorithms** and integrate new fields (e.g. **Freeboard** for the L2 SAR products).

- Baseline C TDS analysis show that the **data quality is improved** as expected !

- The DWS / 6 (MSSL, March 2015) endorsed the Baseline C to go in operation and is used to reprocess data during the **second global reprocessing campaign**

## **Information on the Baseline C changes and improvements:**

<https://earth.esa.int/web/guest/pi-community/news/-/article/expected-changes-for-upcoming-release-of-cryosat-baseline-c>

# Product Evolutions

## • QWG#6 Meeting Highlights

Operational Cal, ice & ocean science L1/L2 product quality is **nominal**

Definition of the **New COP & Ice Processing Baselines**. New COP and Ice IPF release expected by mid 2016 and early 2017

QWG members endorsed the conversion of **ALL products to NetCDF** for next Processing Baselines. Intended implementation in 2016 !

## • QWG#6 Main Recommendations

The QWG and CS users are encouraged to provide inputs to support the **request for a mission extension**

The QWG and CS users are encouraged to provide expertise and justifications to support future perennial or sporadic mask changes

# Table of content

- Context
- Product Evolutions
- SAR acquisitions over Interior Land Ice
- Conclusions and Perspectives

# SAR acquisitions over interior Land Ice

- CS Mask

# SAR acquisitions over interior Land Ice

- Why ?

**Conventional altimetry** acquisitions are **not always suitable** over areas of rough topography inside the interior ice sheet of Antarctica.

CS is the 1<sup>st</sup> **SAR(in) altimeter concept** to be flown on Earth and represents the unique opportunity to process **SAR data over land ice prior to the S3 Launch**

In theory, SAR altimetry should allow better **detections of small scale ice sheet gradients** than LRM

# SAR acquisitions over interior Land Ice

- Preliminary results from past Acquisitions

12/09/2013 (still on going)  
Very small area

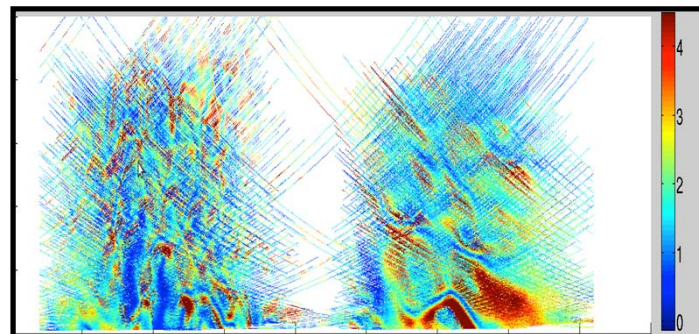

Courtesy S. Dinardo, ESA

Typical SAR waveforms from land ice's interiors similar but **fatter than open-sea waveform** (rougher surface)

SAR waveform over interior Land-ice will **required to be properly modeled** in order to be adequately retracked

DEM (m) from CS SAR

Roughness (m) from CS SAR

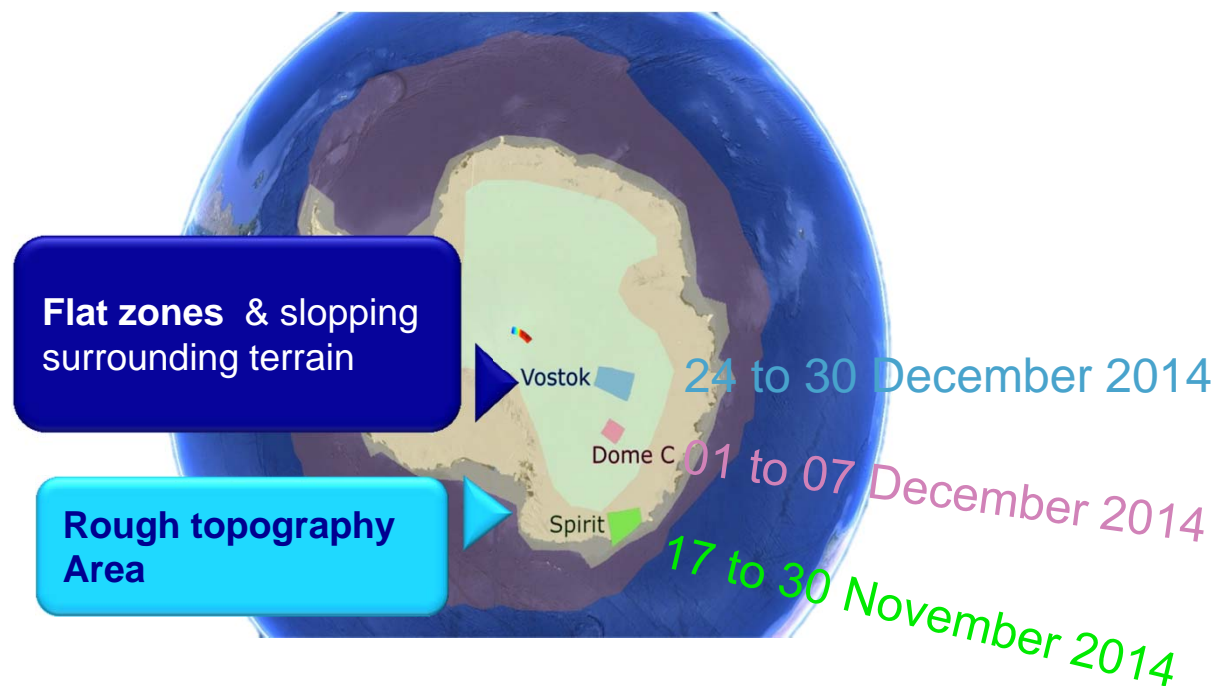

**Good qualitative topography** retrieval for short scale features and lower % of outliers than in LRM

# SAR acquisitions over interior Land Ice

- New Acquisitions

In cooperation with CNES, ESA's CryoSat mission carried out SAR acquisition experiments over Antarctica in order to

Support the development, the validation and the fine-tuning of the **S-3 Ground Processing Algorithms**

Proceed to collocated **comparisons** between LRM, SAR, SARin ....

.... and with other dataset (*in situ*, Stereoscopic DEM from the **SPiRiT**, **TerraSAR-X** acquisition)

# Table of content

- Context
- Product Evolutions
- SAR acquisitions over Interior Land Ice
- Conclusions and Perspectives

# Conclusions and Perspectives

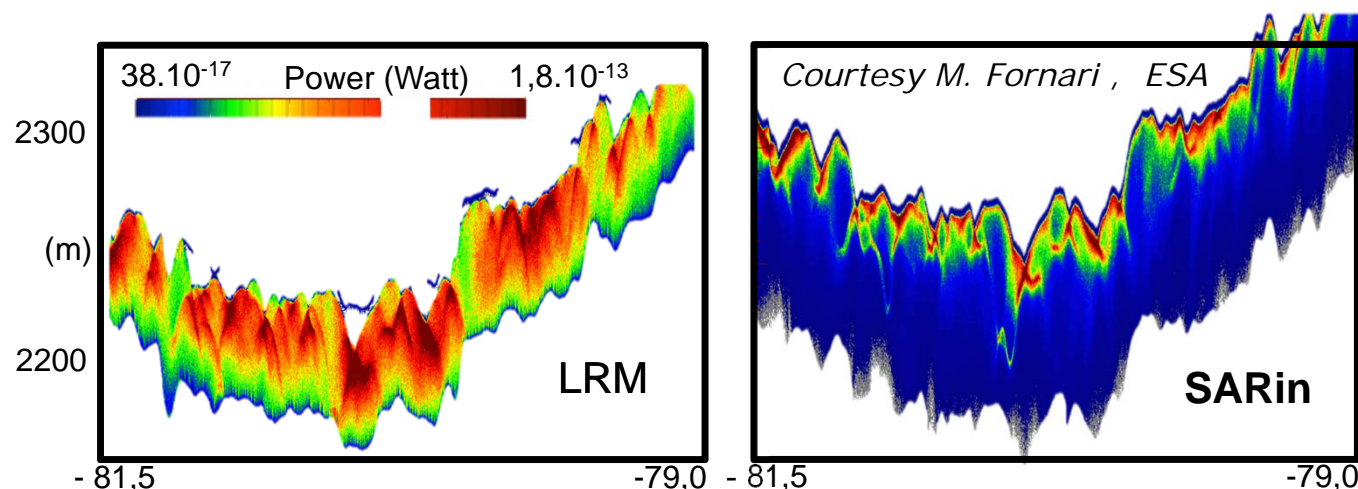

- **SAR Acquisition over Interior Land Ice**

**First results are promising** but space/time limited because inconvenient for usual LRM users and on-board resource consuming

**The full land-ice SAR datasets are made available** to the whole registered CS users

**Feedback from the Scientific Community** of CS users to ESA are highly encouraged in order to support future mask changes

- **SARin Acquisition over Interior Land Ice**

**SARin** acquisitions have been also performed over Antarctica LRM area

SARin tracking never failed, allow High Resolution & **across-track** discriminations

# Conclusions and Perspectives

## • Perspectives

**Demonstrate the potential of SARin** over transitory areas between land ice and sea ice areas as well as over the coastal ocean

**Develop Operational ice products**, parameters and index responding to short and long term societal need (tools for policy maker)

Implement **NetCDF Format** for both COP and Ice Processors (**CR#3**)

Processor upgrades and within the new Baselines of **COP (CR#2, 2Q 2016)** and of the **Ice Processor (3Q 2016)**

**Proposal for mission extension beyond 2017: 3Q 2015 – 1Q 2016**  
(as part of EOEP-4 science review)

4th CryoSat User Workshop (**in LPS16**): 9-13 May 2016

PRAGUE 09-13 MAY 2016

# living planet symposium

PRAGUE  
09-13 May  
2016

**Main Objective:**  
Presentation of Exploitation Results based  
on ESA Earth Observation Measurements

## Important Dates:

Deadline for abstract submission	16 October 2015
Notification of Acceptances	End January 2016
Issue of Preliminary Programme	February 2016
Opening of Registration to the Symposium	February 2016

## Themes:

Atmosphere, Oceanography, Cryosphere,  
Land, Hazards, Climate and Meteorology,  
Solid Earth/Geodesy, Near-Earth  
Environment, Methodologies and  
Products, Open Science 2.0
