Edition 01.0, March 2005

1 Introduction. Document overview

The purpose of this document is to report the major features of the data quality from the Topex/Poseidon mission. The document is associated with data dissemination on a cycle by cycle basis.

The objectives of this document are :

- To provide a data quality assessment
- To provide users with necessary information for data processing
- To report any change likely to impact data quality at any level, from instrument status to software configuration
- To present the major useful results for the current cycle

It is divided into the following topics:

- [**Cycle overview**](#)
- [**CALVAL main results**](#)

2 Cycle overview

2.1 Cycle quality and performances

Data quality for this cycle is nominal.

For this cycle, the crossover standard deviation is 6.46 cm rms. When using a selection to remove shallow waters (1000 m), areas of high ocean variability and high latitudes ($> |50|$ deg.) it decreases down to 6.05 cm rms.

The standard deviation of Sea Level Anomalies (SLA) relative to a 7-year Mean Sea Surface is 11.49 cm. When using a selection to remove shallow waters (1000 m), areas of high ocean variability and high latitudes ($> |50|$ deg), it lowers to 9.62 cm .

2.2 Missing measurements

Passes 169-195 are missing, 196-254 not disseminated because of poor data quality during this period.

2.3 Warnings and recommendations

- Missing measurements :
 - Since October 08th all mission data recovery requirements have been met via TDRSS real time contacts.
Therefore there is a lot of data gaps, especially in the Indian Ocean, between the East and Southeast Pacific basin, in the South Pacific Ocean close to the South and Central America coasts and below the Groenland coasts.
 - The satellite experienced a pitch reaction wheel halt on 17, December, resulting in loss of Earth-Pointing. After several attempts pitch wheel operation was finally restored and the Satellite was commanded back to the Fine Pointing Normal Mission Mode on 21,December.
Therefore passes 169-195 are missing, and all measurements of passes 196 to 254 are removed by the quality flags.
Thus only passes 1 to 168 will be disseminated to the scientific community.
- Doris switch off :
The DORIS instrument was switched off since the incident on 01, November 2004. All the POE requirements are now met using lasernet tracking data. Only bent ionospheric correction is available.
- Measurements edited by the TMR parameters :
The following anomalies are explained by the problems in the interpolation of the TMR parameters due to tape recorder failures :
 - 7.09% of the measurements are removed by the TMR correction criterion.
 - Some measurements have radiometer earth flag set to valid over earth. A new criterion has been added to the editing procedure to remove all these measurements (see [Editing](#)).

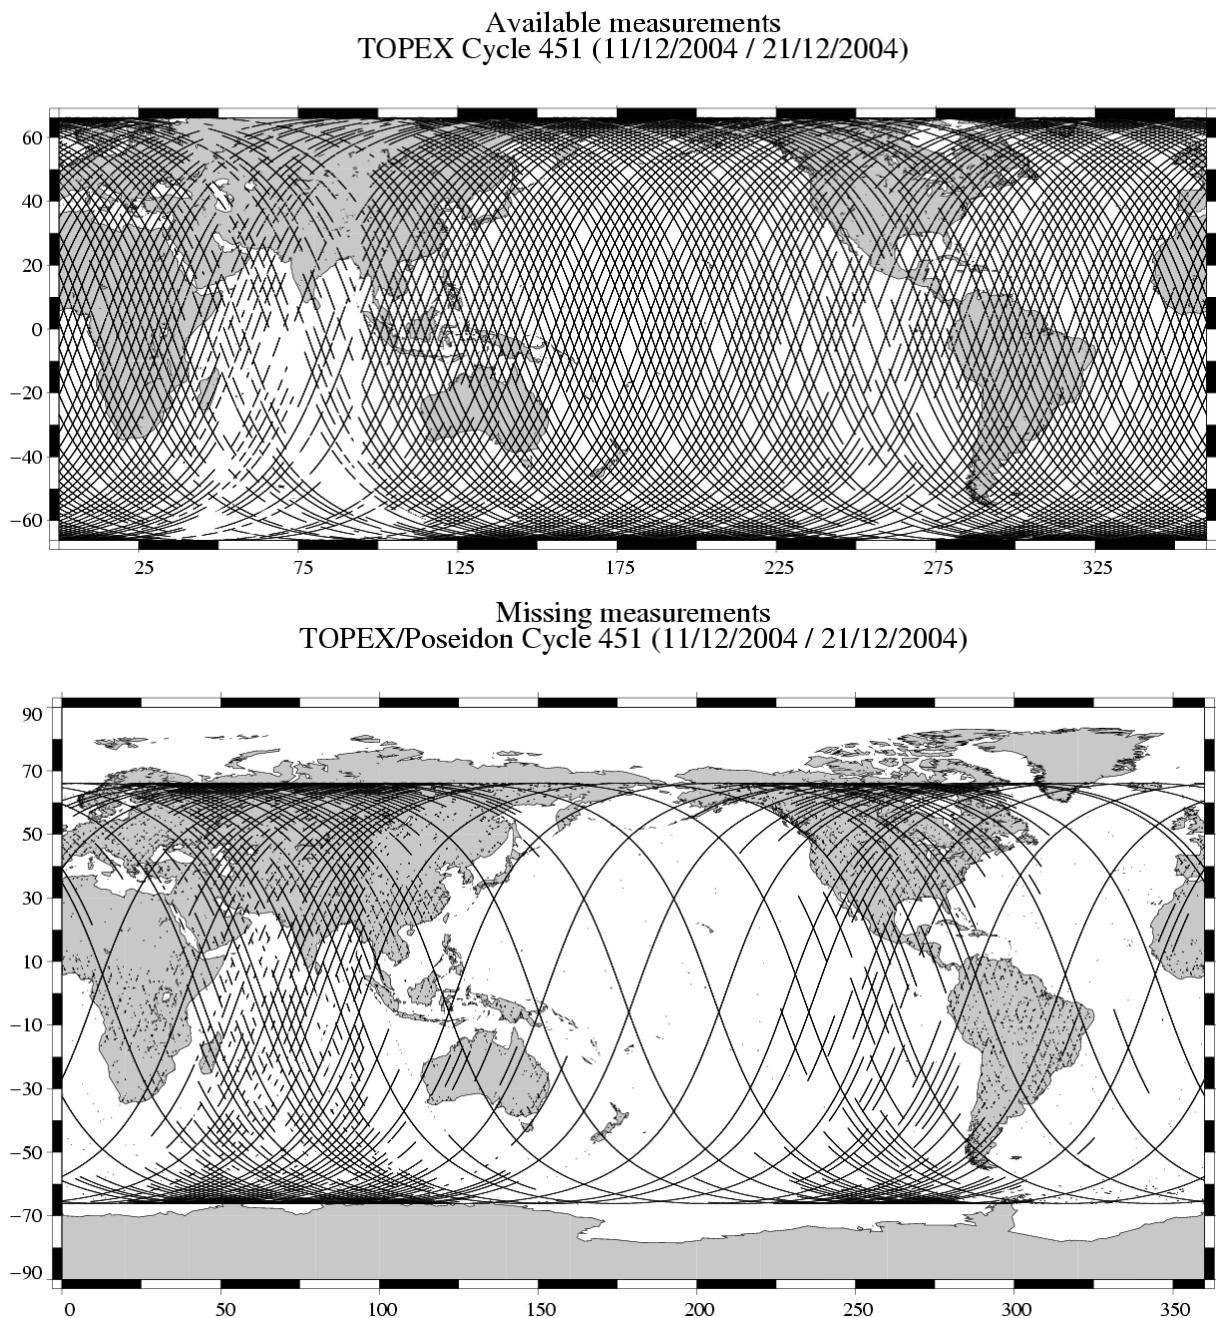

3 CALVAL main results

This section presents results that illustrate data quality during this cycle. These verification products are produced operationally so that they allow systematic monitoring of the main relevant parameters.

3.1 Missing measurements

558583 altimeter measurements are present, and 236087 are missing.

The map below shows all the available measurements for this cycle and illustrates the tape recorder problems. The latter figure shows missing 1Hz measurements in the GDRs, with respect to a 1 Hz sampling of a nominal repeat track.

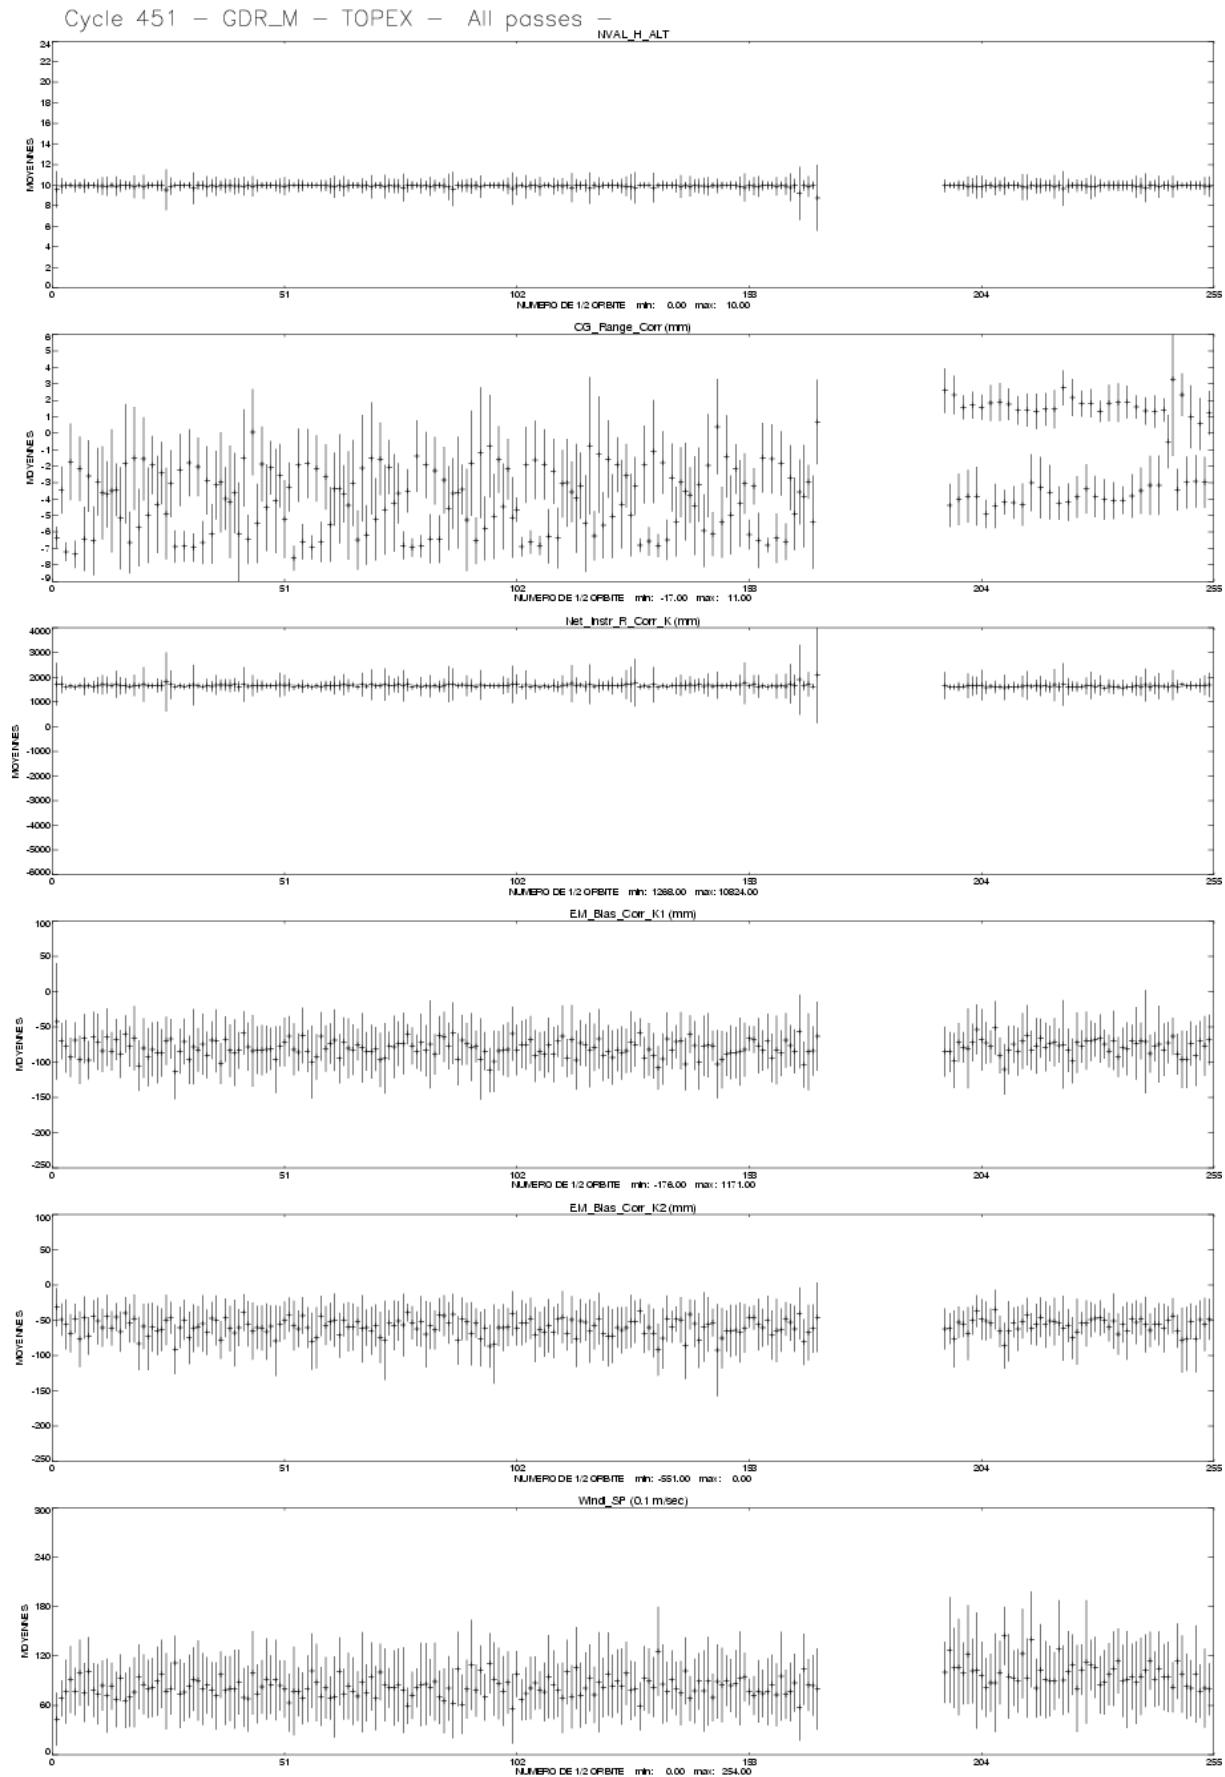

3.2 M-GDR quality flags

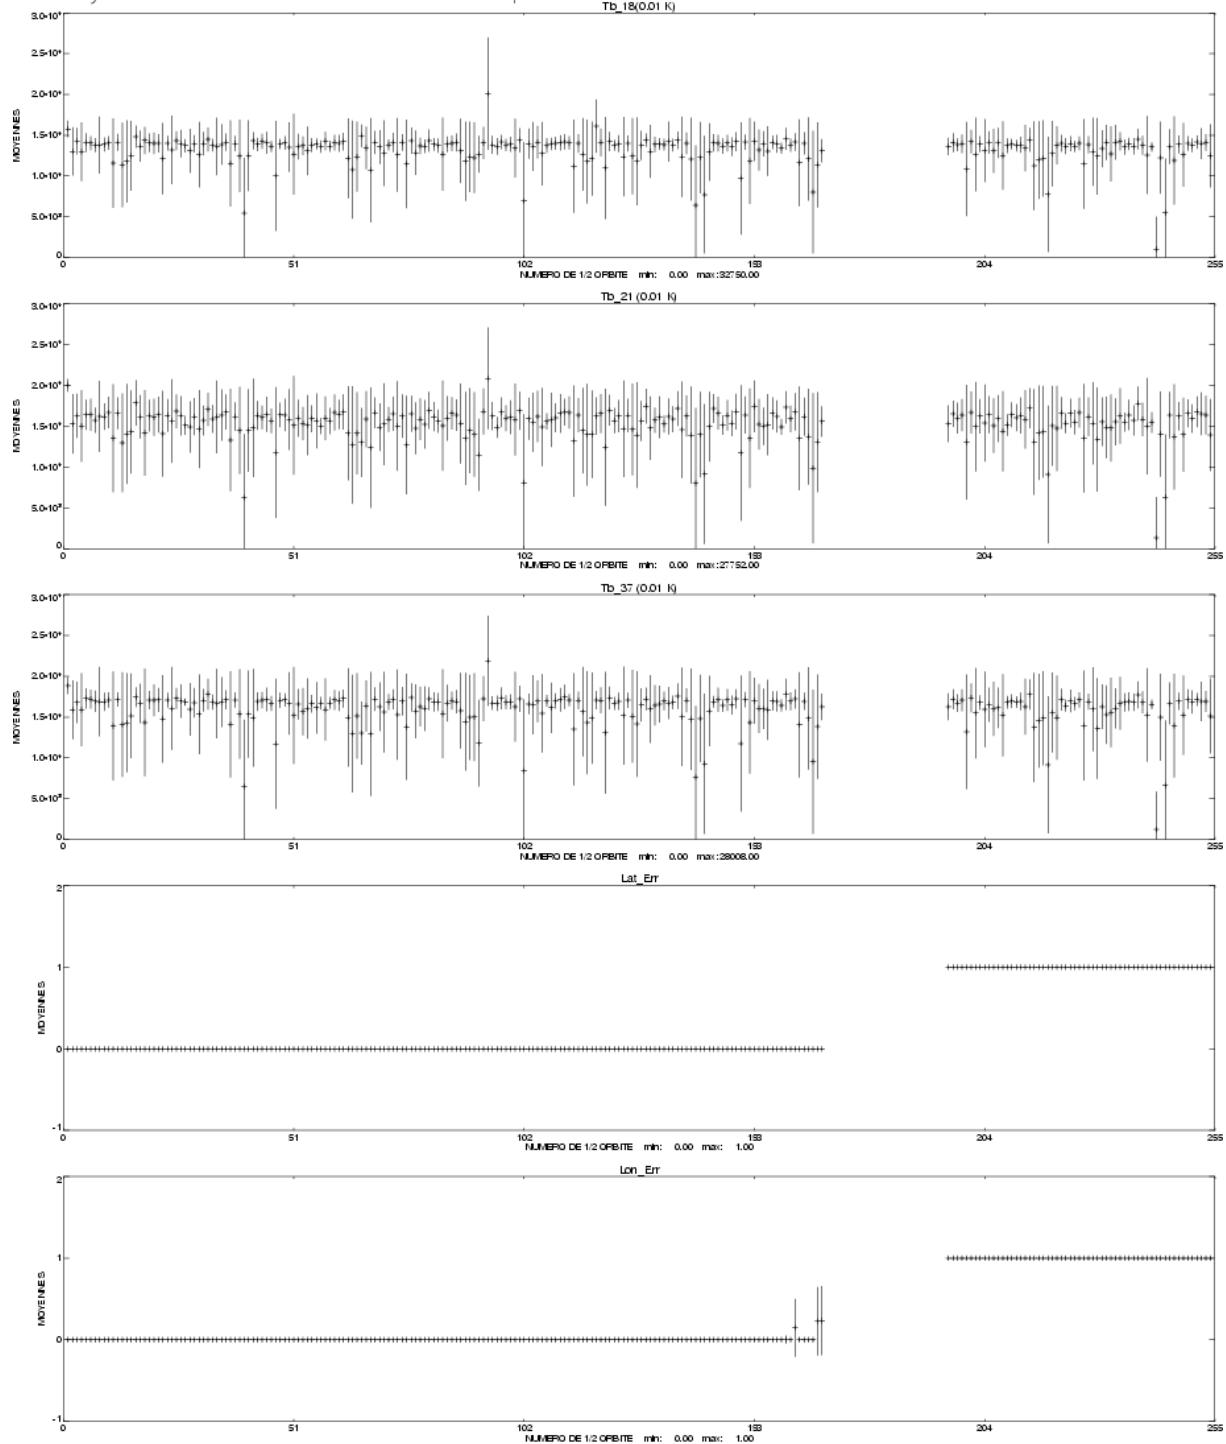

The following table indicates the percentage of measurements for which those flags are set.

| Name | Description | % bad |
|-----------|---|-------|
| Geo_Bad_1 | altimeter land flag | 25.47 |
| Geo_Bad_1 | ice flag | 5.57 |
| Geo_Bad_1 | radiometer land flag | 26.51 |
| Alt_Bad_1 | conditions 1 altimeter | 26.11 |
| Alt_Bad_2 | conditions 2 altimeter | 5.91 |
| Geo_Bad_2 | rain (liquid water in excess) | 10.03 |
| Geo_Bad_2 | less than 4 points for CSR3.0 tide calculation | 0.37 |
| Geo_Bad_2 | less than 4 points for FES95.2.1 tide calculation | 2.63 |
| TOPEX | TOPEX not valid | 0.00 |
| TMR | TMR not valid | 0.00 |
| TMR_Bad | Brightness temperatures not valid | 11.52 |
| DORIS | DORIS not valid | 0.00 |

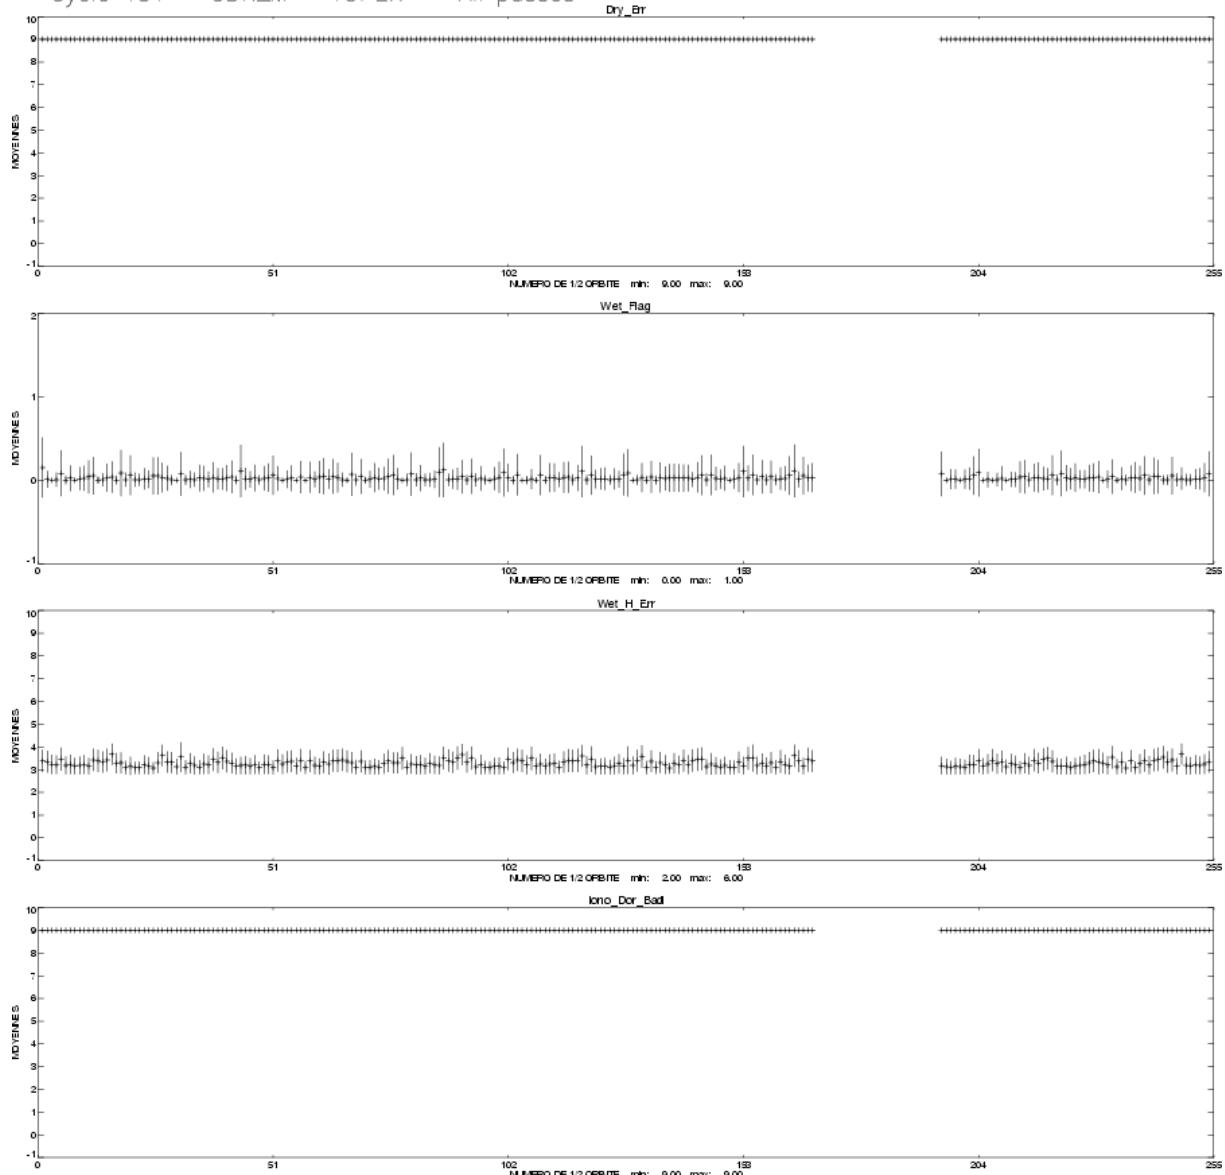

3.3 M-GDR parameter plots

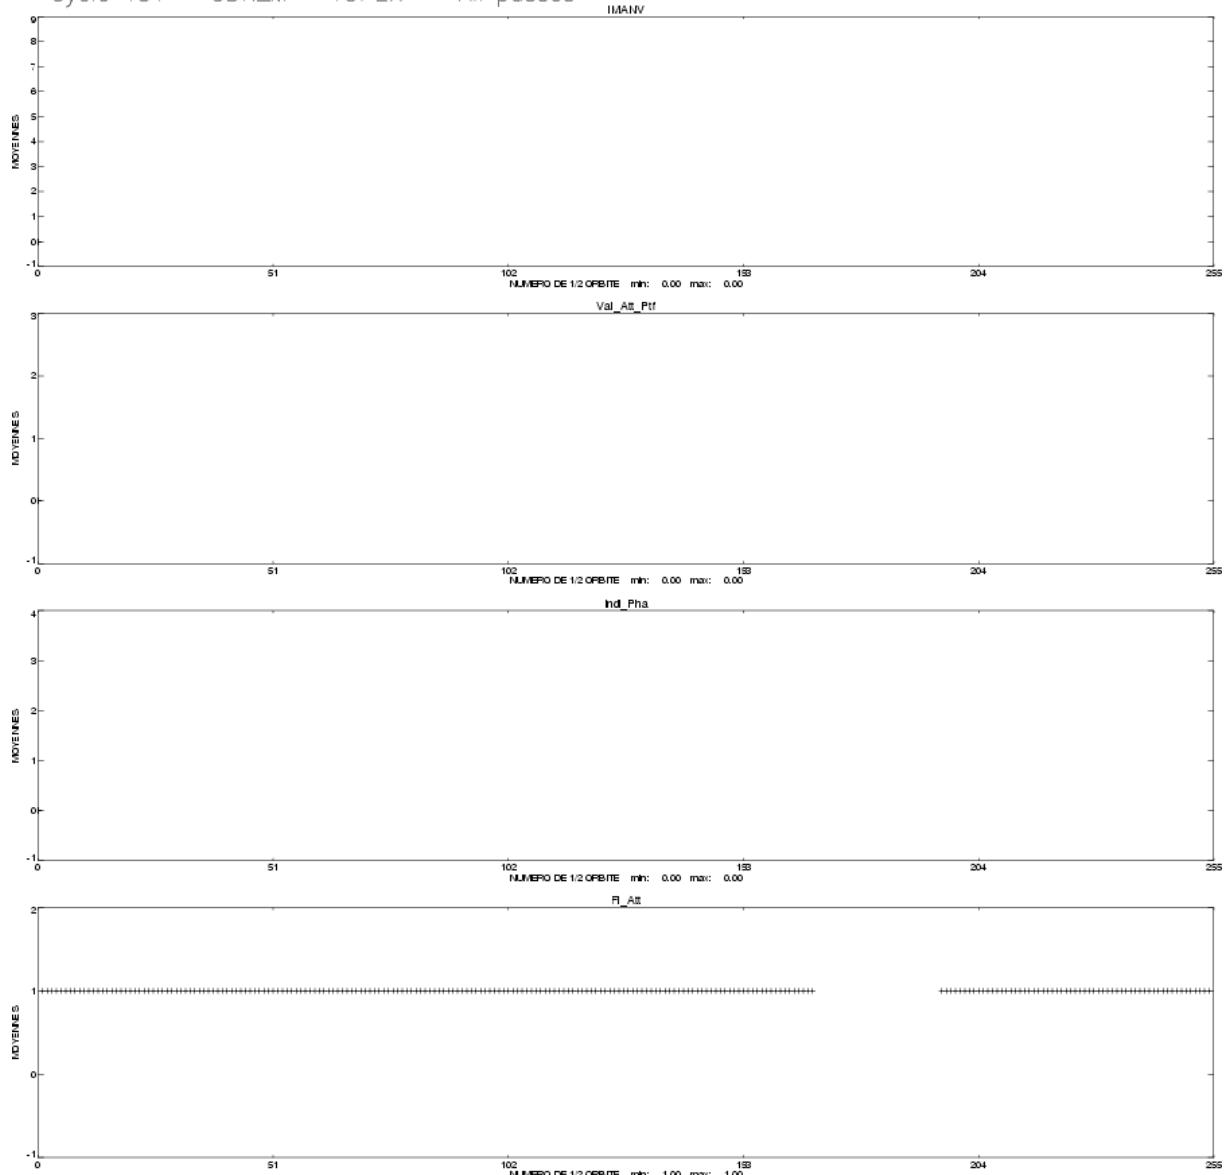

Cycle 451 – GDR_M – TOPEX – All passes –

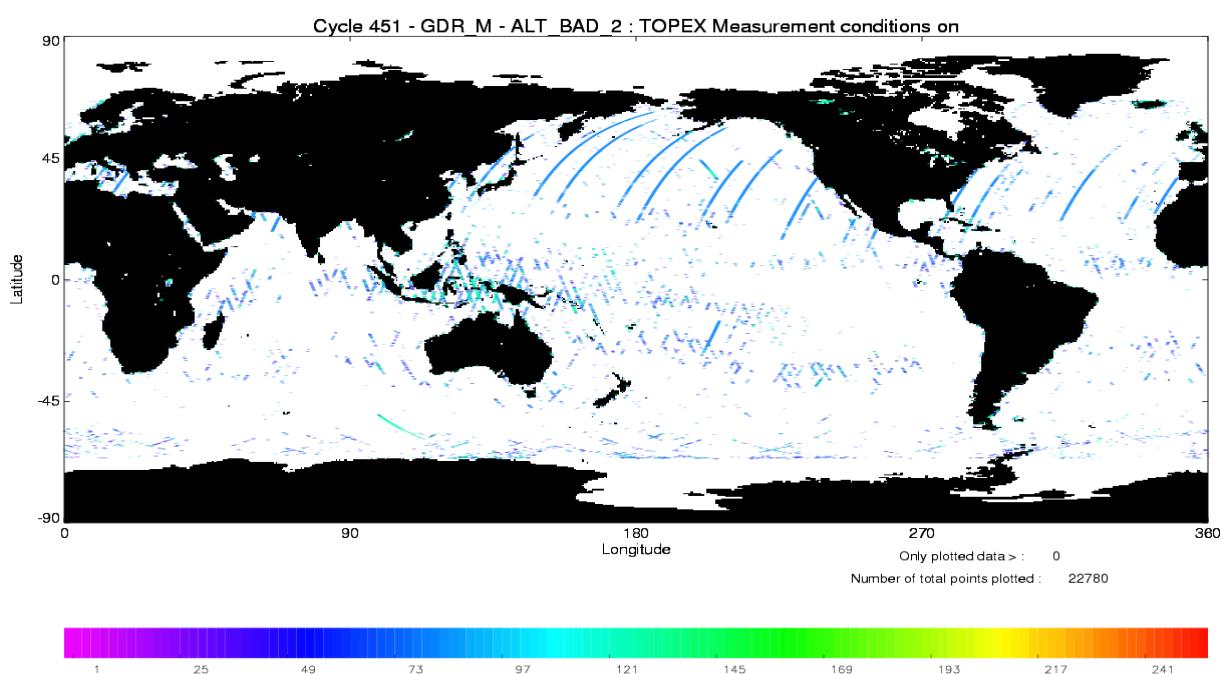

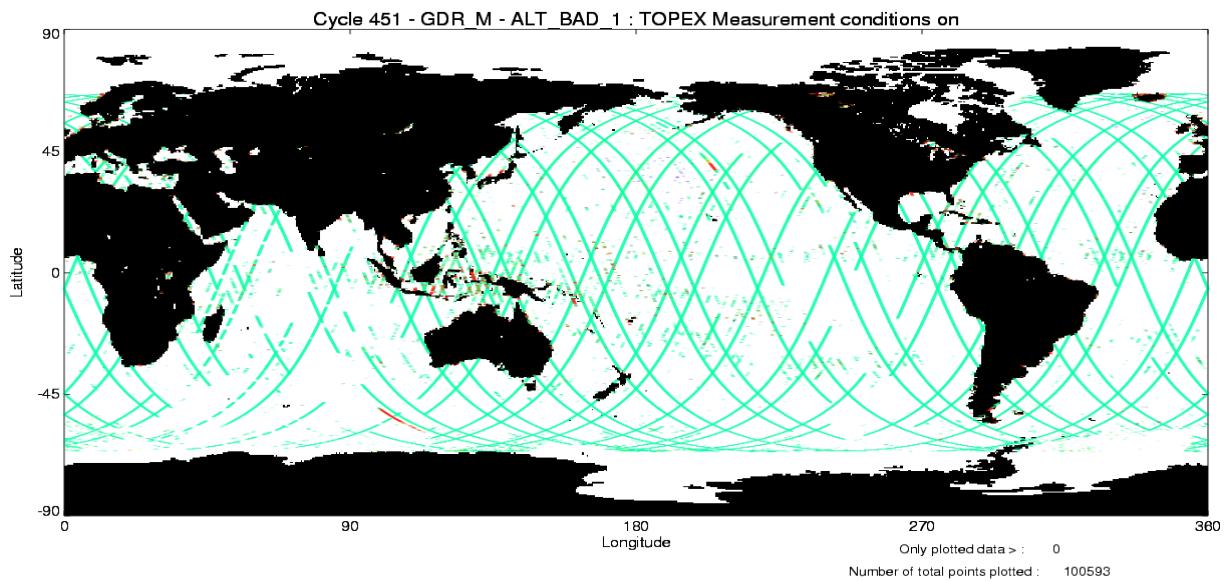

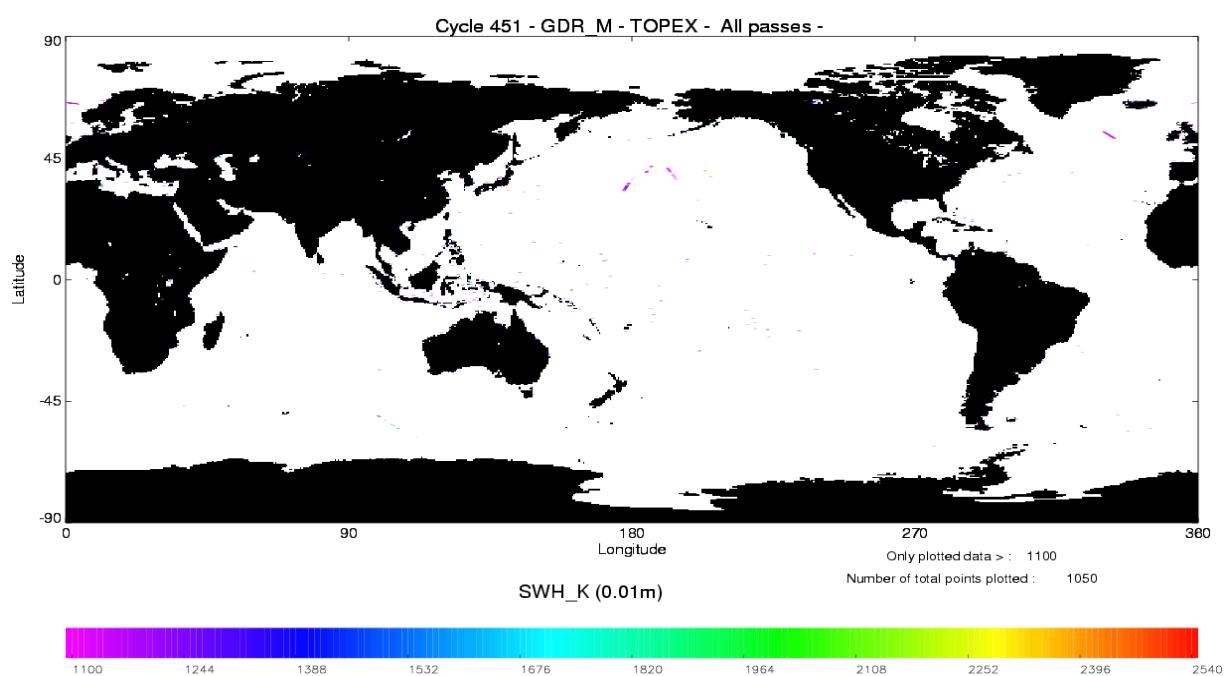

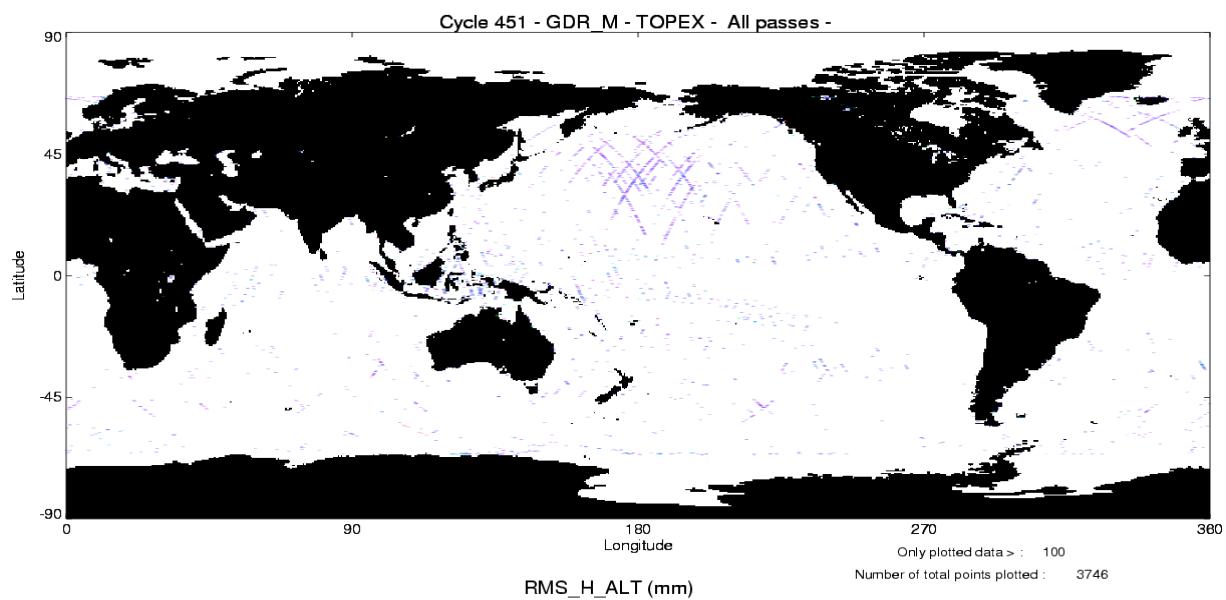

Cycle 451 – GDR_M – TOPEX – All passes –

3.4 Editing

The following table gives for each tested parameter, minimum and maximum thresholds, the number and the percentage of points removed. As a comparison, the mean percentage over one year (1997) is also given.

There are problems in the interpolation of the TMR parameters since cycle 371 when there are missing measurements (tape recorder failures). These bad measurements are removed by the TMR correction criterion but some of them have been kept. Thus a new criterion has been added to the editing procedure since the cycle 376 to remove all the measurements where the absolute value of the difference between the TMR correction and the ECMWF model wet tropospheric correction is greater than 20 cm.

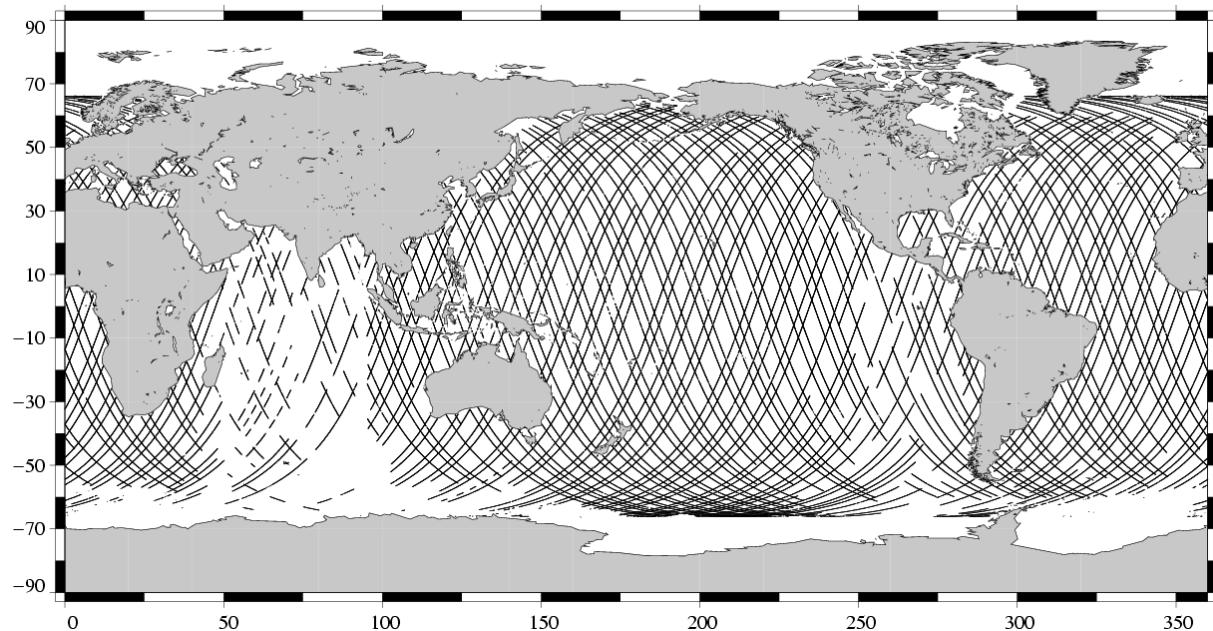

Probably due to the interpolation problem with the TMR, some measurements have radiometer land flag unset over land. This has no impact on the valid data because these measurements have been edited by the altimetric parameter criteria. Nevertheless, this anomaly leads to wrong statistics of the edited measurements. Therefore a new criterion has been added in the editing procedure to remove all the measurements for which the radiometer land flag is set to ocean and the altimeter land flag is set to land.

The number and percentage of points removed by each criterion is given on the following table. Note that these statistics are obtained with measurements already edited for radiometer land flag (26.51 % of points removed) and ice flag (5.57 % of points removed).

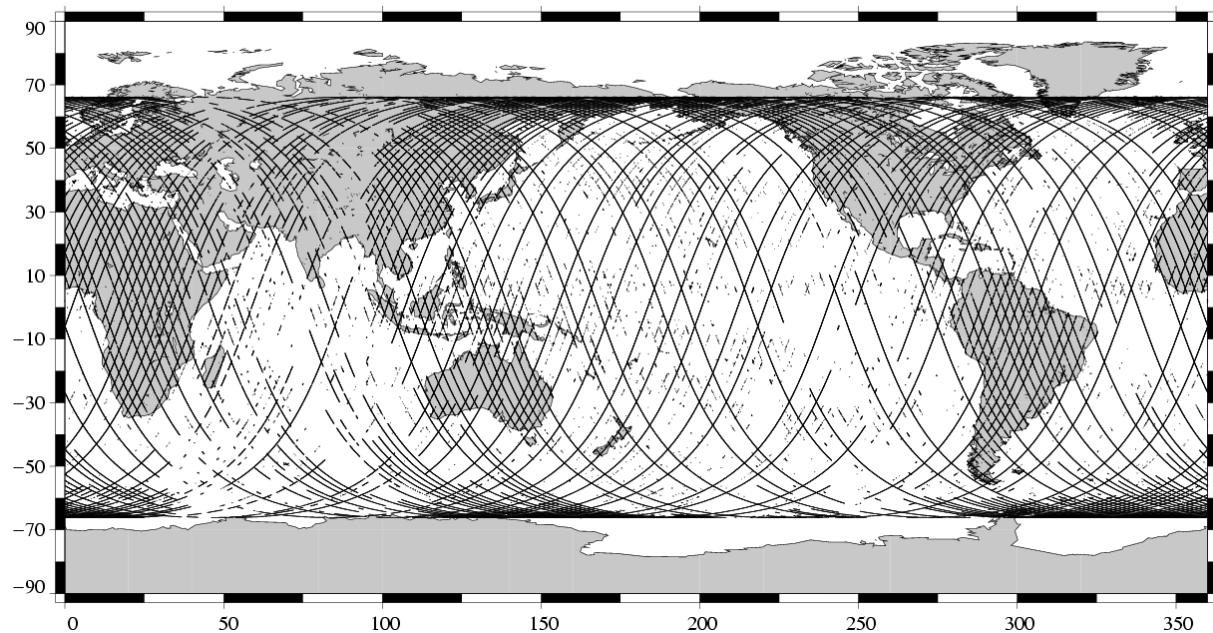

| Parameters | Min Thres. | Max Thres. | Unit | Mean removed in 1997 | % removed |
|---|------------|------------|------|----------------------|-----------|
| Sea surface height | -130.000 | 100.000 | m | 1.37 | 26.84 |
| Number of 20/10Hz valid points Poseidon/TOPEX | 5.000 | - | | 1.37 | 0.30 |
| Std. deviation of range | 0.000 | 0.100 | m | 1.85 | 1.08 |
| Off nadir angle from waveform | 0.000 | 0.400 | deg | 1.36 | 9.08 |
| Dry tropospheric correction | -2.500 | -1.900 | m | 0.00 | 0.00 |
| Invert barometer correction | -2.000 | 2.000 | m | 0.00 | 0.00 |
| TMR wet tropospheric correction | -0.500 | -0.001 | m | 0.34 | 7.09 |
| Ionospheric correction (Poseidon:Doris, TOPEX:Dual) | -0.400 | 0.040 | m | 0.00 | 0.32 |
| Significant wave height | 0.000 | 11.000 | m | 1.46 | 0.16 |
| Sea state Bias | -0.500 | 0.000 | m | 1.39 | 0.98 |
| Backscatter coefficient | 7.000 | 30.000 | dB | 1.44 | 1.75 |
| Ocean tide height | -5.000 | 5.000 | m | 0.01 | 0.14 |
| Earth tide | -1.000 | 1.000 | m | 0.00 | 0.00 |
| Pole tide | -15.000 | 15.000 | m | 0.00 | 0.00 |
| TMR and ECMWF tropospheric differences | -0.200 | 0.200 | m | NaN | 0.48 |
| Spline fitting | | | | | 0.01 |

The following three maps are complementary: they show respectively the removed, the selected measurements and the percentage of selected measurements in the editing procedure.

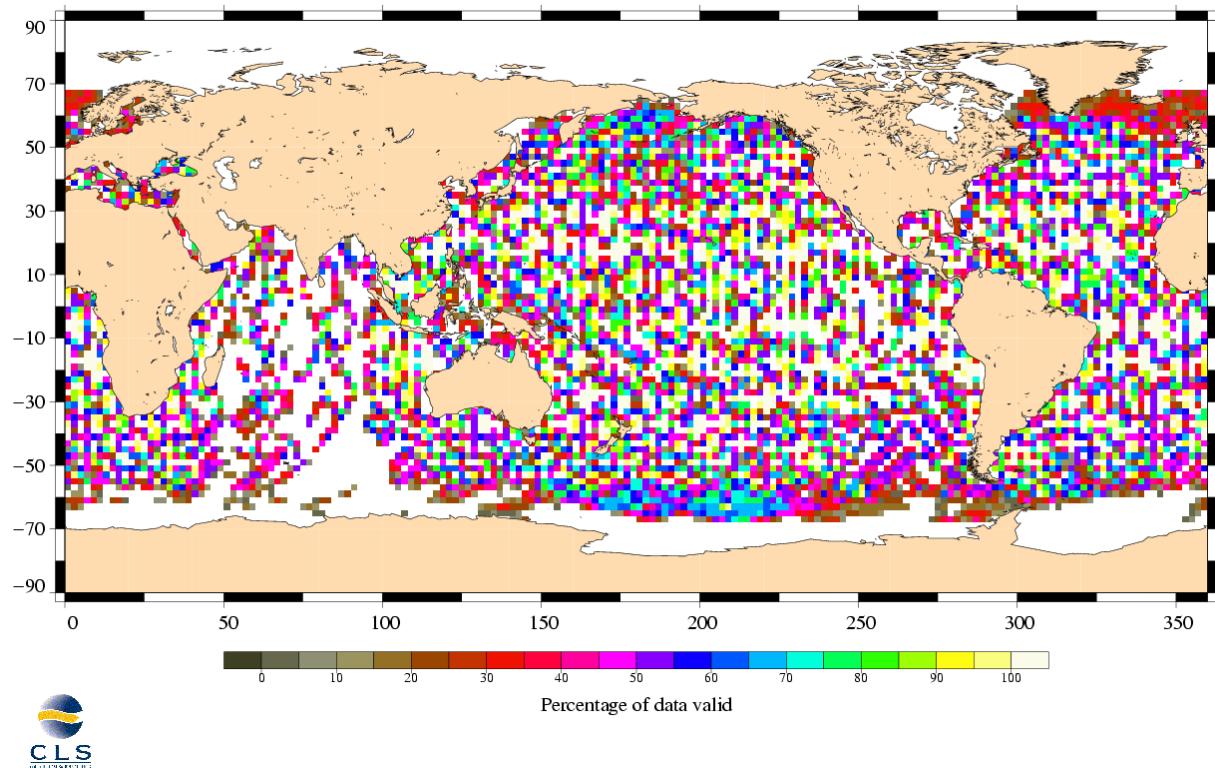

Valid data

3.8 SSH variability

3.8.1 Sea Level Anomaly

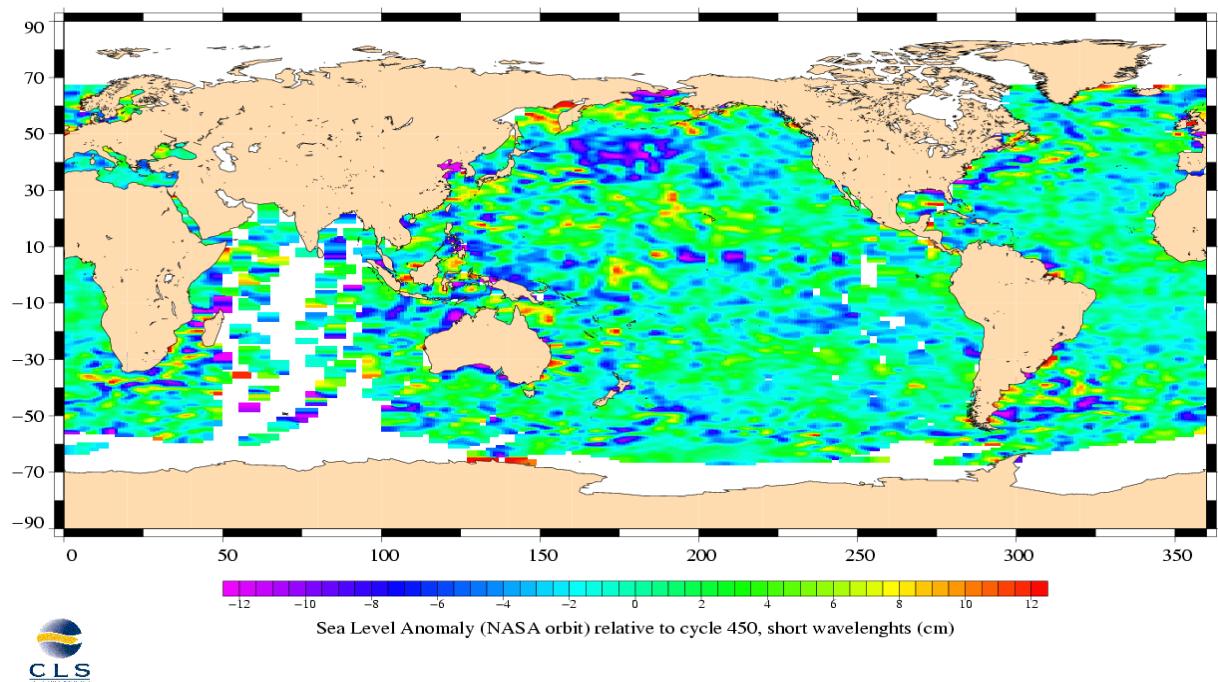

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004

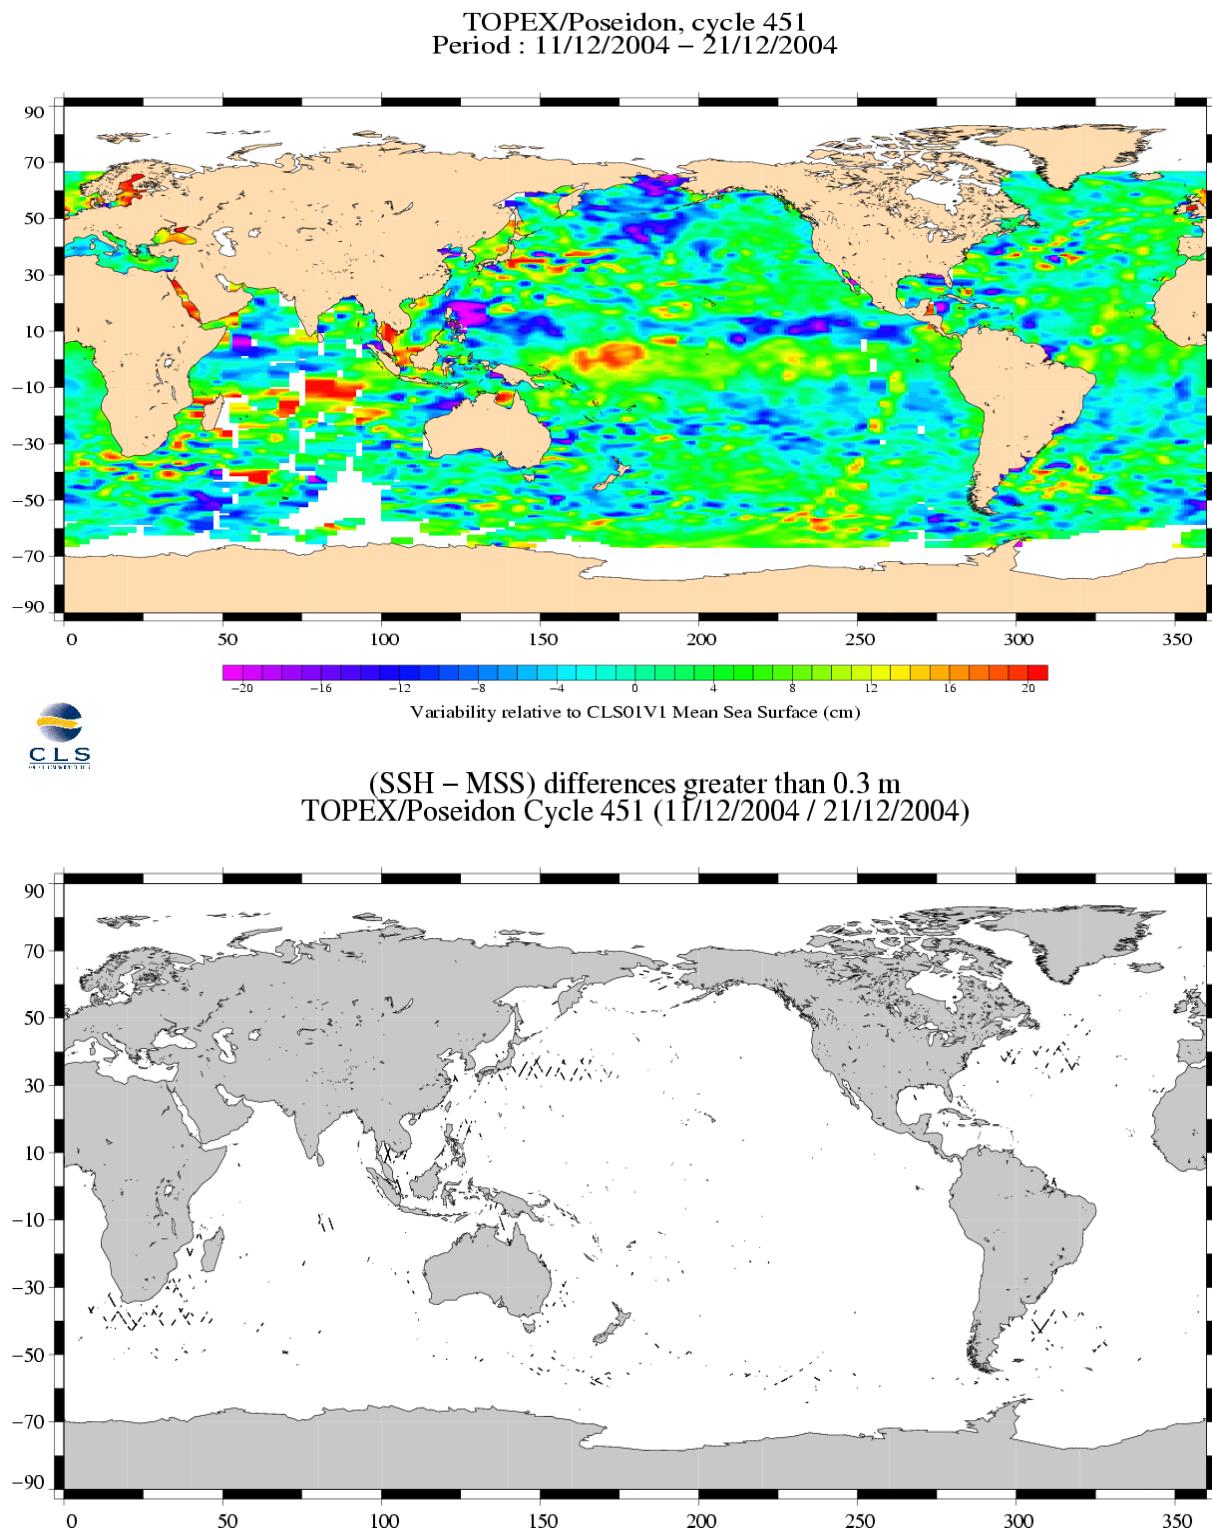

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004

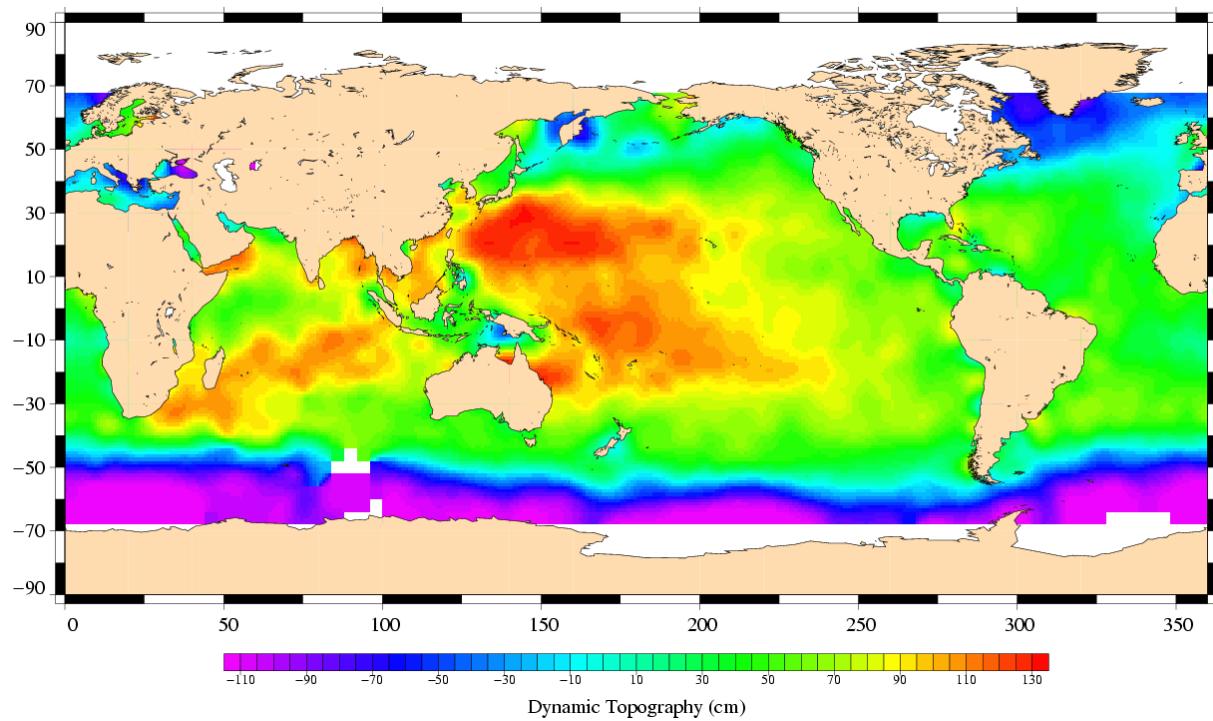

3.8.2 Comparison to a precise Mean Sea Surface

The CLS (2001) MSS model is used as a reference to compute SLA. The two following maps respectively show the map of Topex SLA relative to the MSS and differences higher than a 30 cm threshold (after centering the data). The latter figure shows that higher differences are located in high ocean variability areas, as expected.

3.9 Dynamic topography

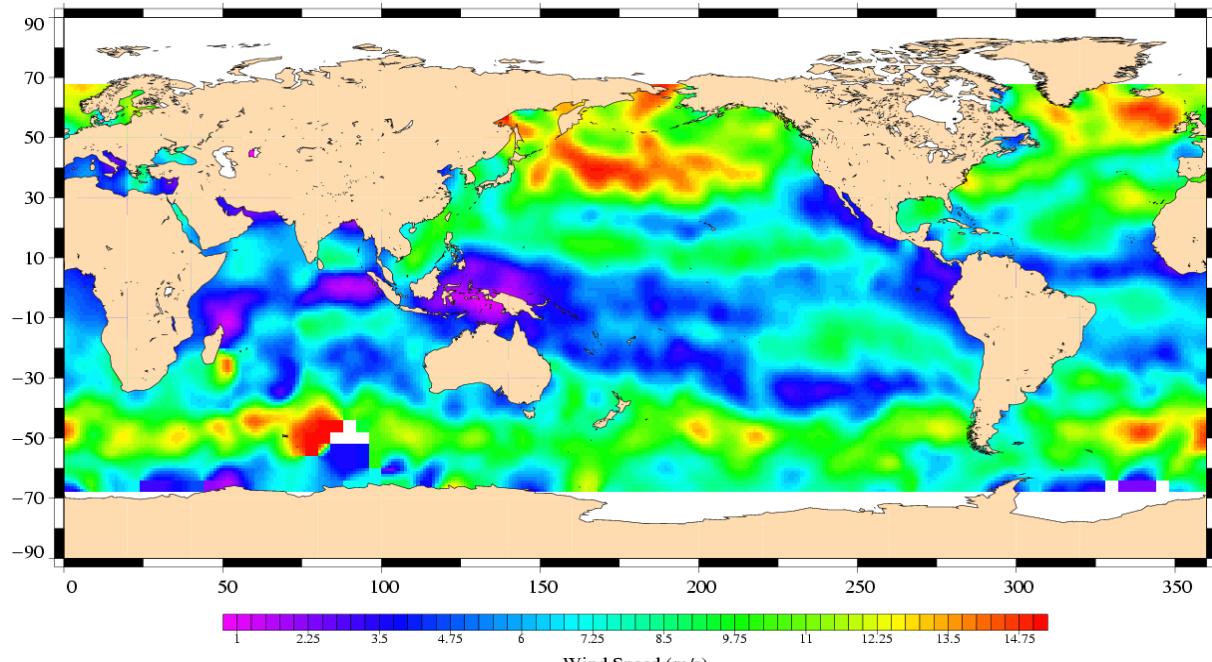

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004

3.10 Wind and wave maps

These two figures show wind and wave estimations derived from 10 days of altimeter measurements.

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004

TOPEX/Poseidon, cycle 451
Period : 11/12/2004 – 21/12/2004
