## 1 General description

- Figures and notes have been included in this report to evaluate different altimetry products.
- In order to test different version of the Ionospheric correction used to calculate the sea level anomaly. Each version has been compared with a reference version. In this case the Iono\_gim is the reference one.
- The sea level anomaly has been calculated using each version of the variable and has been compared to the sea level anomaly calculated using the reference version.
- The region of study is Eaustralia
- Mission : J2
- Git last tag : 0.7 Appliquer le flag à l'adaptive
- Git changeset number : b8633aa-2022-04-11

## 2.2 Binning

Each track has been divided to a set of sections, where the center of each section is separated by the sample frequency of the satellite times it's velocity.

The data located within the sections limits represent the altimetry time-series on which the statistics will be calculated and visualized in this report.

## 2.3 Filtering

- The sla has been filtered by a threshold of 3 m.
- Each sla time-serie has been filtered by a window of  $[-4\sigma, 4\sigma]$ , where  $\sigma$  is the standard deviation of the sla time serie

## 6 Comparison with Insitu Data (Tide Gauge)

The size of the marker representing each point in the figures below increase by getting closer to the coast

### 6.1 Station : Lorne\_Jetty

- Nearest track to Lorne\_Jetty station is the track number track88
- The area of interest is limited by :
  - A circle which it's center is the Lorne\_Jetty tide gauge station location and has a Raduis of 40 Km
  - Maximum distance to the coast : 20 Km

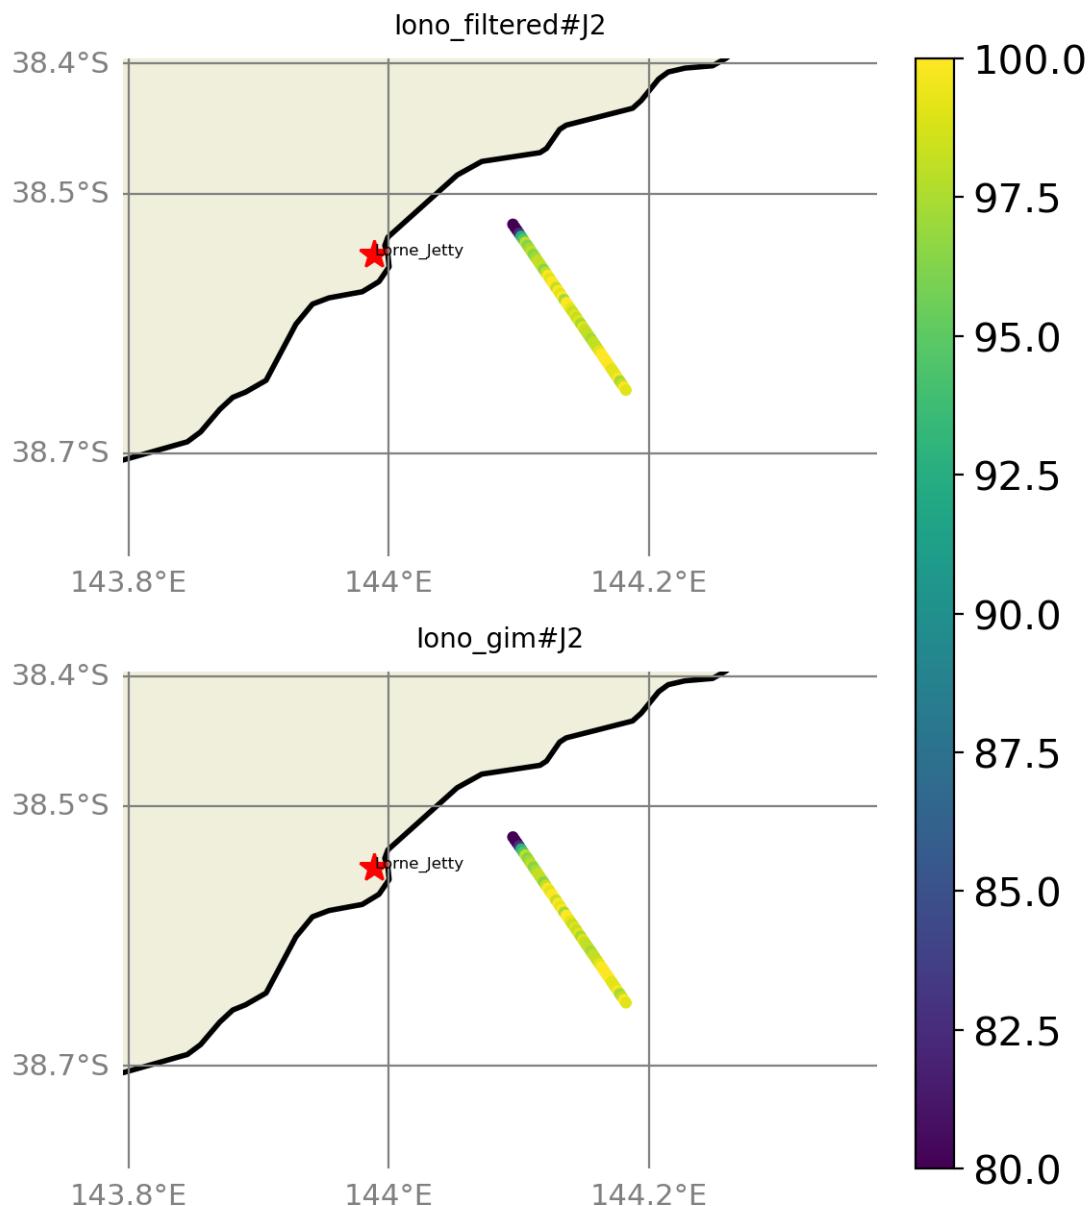

FIGURE 31 – valid\_data\_percent visualization in maps view % Lorne\_Jetty tide gauge

#### 6.1.5 Valid data (%) in function of distance to coast/Lorne\_Jetty station

The formula to calculate the percentage of valid data in each time serie is;

$$pvdi = \frac{nvd_i}{maxNB}, i = 1, np$$

Where  $pvdi$  and  $nvd$  are the percentage of data and the number of altimetry data in the period covered by the tide gauge sla time serie, respectively in the time serie,  $i$  is the index of the time serie,  $np$  is the number of the selected altimetry time series.  $maxNB = 109$  point is the maximum number of valid altimetry points in the set of all the altimetry sla time series covered by the period of time of the Tide gauge sla time serie.

#### 6.3.5 Valid data (%) in function of distance to coast/Thursday\_Island station

The formula to calculate the percentage of valid data in each time serie is;

$$pvd_i = \frac{nvd_i}{maxNB}, i = 1, np$$

Where  $pvd$  and  $nvd$  are the percentage of data and the number of altimetry data in the period covered by the tide gauge sla time serie, respectively in the time serie,  $i$  is the index of the time serie,  $np$  is the number of the selected altimetry time series.  $maxNB = 51$  point is the maximum number of valid altimetry points in the set of all the altimetry sla time series covered by the period of time of the Tide gauge sla time serie.
