1. Introduction

The purpose of this document is to describe products generated by the 1Hz monomission along-track altimeter data processing segment for Sentinel-3A and Sentinel-3B missions, named along-track L2P SLA products.

The generation of those products is part of the EUMETSAT Sentinel-3 Marine Altimetry L2P/L3 Service. The dissemination of those products is part of the Cnes AVISO-SALP (Service d’Altimétrie et Localisation Précise).

After a description of the input data, a short overview of the processing steps is presented. Then complete information about user products is provided, giving nomenclature, format description, and software routines.

Note that L2P SLA products are also available for other altimeter missions (Cryosat-2, SARAL/AltiKA, HaiYang-2A, Jason-3, OSTM/Jason-2, Jason-1, Geosat Follow On, ERS-1, ERS-2 and Envisat). The generation and dissemination of those products is part of the CNES SALP (Service d’Altimétrie et Localisation Précise). The handbook for these L2P products is available at:

2. Overview

2.1. Altimetry principle

The altimeter measures the ‘Altimeter Range’ which is the distance between the center of mass of satellite to the surface of the Earth (figure 1). This allows computing the ‘Sea Surface Height’ which is the height of the sea surface above the reference ellipsoid. The ‘Satellite Altitude’ refers to the distance of the center of mass of the satellite above a reference point. The reference point will usually be either on the reference ellipsoid or the center of the Earth.

‘Sea Surface Height’ = ‘Satellite Altitude’ - ‘Altimeter Range’ - ‘Corrections’

The ‘Corrections’ due to environmental conditions need to be applied in order to retrieve the correct ‘Sea Surface Height’. They are listed in Table 2 and depend on the timeliness of the product.

Moreover another variable is often used in altimetry:

‘Sea Level Anomaly’= ‘Sea Surface Height’ - ‘Mean Sea Surface’

The ‘Mean Sea Surface’ is the mean of the sea surface height relative to ellipsoid over 20 years. It is computed on a regular grid and combines the data of all satellites.

The Reference ellipsoid used for Sentinel-3 Along-track L2P product is the first-order definition of the non-spherical shape of Earth with (same as for TOPEX/Poseidon, Jason-1/2/3 series):

- equatorial radius of 6378.1363 kilometers
- flattening coefficient of 1/298.257

Figure 1. Altimetry principle
2.1.1. Orbits, Passes and Repeat cycle

‘Orbit’ is one revolution around the Earth by the satellite. A satellite’s ‘Pass’ or ‘Track’ is half a revolution of the Earth by the satellite from one extreme latitude to the opposite extreme latitude. Passes with odd numbers correspond to ascending orbits, from minimum to maximum latitude; passes with even numbers correspond to descending orbits, from maximum to minimum latitude.

‘Repeat Cycle’ is the time period that elapses until the satellite flies over the same location again. Every “pass file” of a given cycle (identified by its track number) flies over the same path as the pass file of every other cycle in the same repeat-cycle phase, and covers oceans basins continuously.

For Sentinel-3A and Sentinel-3B:
- the inclination is 98.65 deg;
- the passes are numbered from 1 to 770 representing a full repeat cycle ground track for the repetitive orbit;
- the repeat cycle is 27 days.

2.2. Sentinel-3 operating mode

In the Sentinel-3 SRAL mission, there are two main modes of operation:
- High Resolution Mode, also known as Synthetic Aperture Radar mode (SAR)
- Low Resolution Mode (LRM)

The SRAL mission will normally be operated at High Resolution Mode (commonly called SAR mode). Low Resolution Mode (LRM) will be a back-up mode only.

SAR mode is designed to achieve high along-track resolution over relatively flat surfaces. This property can be exploited to increase the number of independent measurements over a given area and is a prerequisite for sea-ice thickness measurements, coastal waters, ice sheet margins, land and inland waters. The scientific justification of High Resolution Mode 100% coverage over the Earth is also applicable to open ocean surfaces because studies have shown that the best performance of this mode is over open ocean surfaces where topography is homogeneous (areas at least as large as the antenna footprint).

The detailed information can be found in Sentinel-3 User Handbook:
- Sentinel-3 SRAL Marine User Handbook (EUM/OPS-SEN3/MAN/17/920901)

Note that compared to LRM (on current altimetry missions such as SARAL/AltiKa, Envisat, Jason-1/2/3, ERS-1/2), the antenna footprint is reduced with the SAR technology and the noise on the measurement is reduced.
3. Data Processing

3.1. Overview

The processing steps of the system are overviewed on Figure 2. The L2P products are delivered in Near-Real-Time (NRT), Short Time Critical (STC), Non Time Critical (NTC). The objective is:

- To provide operational applications with directly useable continuous and high quality altimeter data.
- To provide user friendly altimeter database where users can directly access to valid sea level height content without additional processing.
- In Non Time Critical, it is to maintain a consistent and user friendly altimeter database using the state-of-the-art recommendations from altimetry community before the complete reprocessing of L2 products.

![Figure 2. Processing steps of the system](image)

The L2P products are along-track products that contain time, sea level anomaly, information of validity of the data and all corrections which were necessary to compute the sea level anomaly (range, orbital altitude, environmental and geophysical corrections). These products contain only marine surfaces. They have a homogenized format and content for all altimeter missions. Note that the variable inter_mission_bias can be different between L2P NRT/STC and L2P NTC data. L2P products are the input data for the L3 production (which are distributed by CMEMS). Note that the sea level anomaly considered in Sentinel-3 L2P products is always based on Synthetic Aperture Radar (or if not available on Low Resolution Mode) data, but never on Pseudo LRM data.
3.2. Input Data

3.2.1. Level-2 altimeter data

In order to produce Sentinel-3A and Sentinel-3B Along-track L2P products, the system uses Level-2 Water instrumental measurements (containing Ocean data). Indeed, there are different data products associated with the three levels of processing of altimeter data:

- Level-0 (L0) is the raw telemetered data
- Level-1 (L1) is the Level-0 data corrected for instrumental effects
- Level-2 (L2) is the Level-1 data corrected for geophysical effects

Level-2 and level-1 products are available to users via ftp or EUMETCast dissemination. Level-0 products are not available to users and are considered only as inputs to Level-1 processing.

There are different levels of data latency related to the Level-2 availability of the auxiliary or ancillary data as detailed in Table 1:

Table 1. Sentinel-3A and Sentinel-3B timeliness Input data overview.

3.2.1.1. Dynamic and static auxiliary data

In order to compute the Sea Level Anomaly, various corrections are needed, some of them replace the ones from the L2 input product such as the Mean Sea Surface, the tidal model, etc. The complete description of all the corrections used in the L2P products is given in Table 2.

3.3. Applying altimetric corrections

Altimetric measurements need to be corrected for instrumental errors, environmental perturbations (wet tropospheric, dry tropospheric and ionospheric effects), the ocean sea state influence (sea state bias), the tide influence (ocean tide, earth tide and pole tide) and atmospheric pressure (combined atmospheric correction: high frequency fluctuations of the sea surface topography and inverted barometer height correction).

Note that other corrections could be applied if needed, such as a datation bias correction. Note that this algorithm is not yet used.
The detail of the corrections applied is given in table 9. This table corresponds to the current available L2P standard (global attribute “product_version” in the L2P files) for NRT, STC and NTC products. Note that the product_version may develop differently between L2P NRT/STC and L2P NTC products.

Note that in Non-Time Critical (NTC) delivery, the products may be delivered in two versions:

- the reference version containing the corrections consistent with the Sentinel-3A or Sentinel-3B products delivered in the frame of the Copernicus Marine Service project. This version will be reprocessed roughly every 3 years.
- an updated version with corrections more up-to-date. This version will be reprocessed more often.

### 3.4. Selecting valid data

The processing starts with quality control and validation of altimetric data and geophysical corrections in order to select valid ocean data. Note the following values of the editing criteria are not yet tuned for Sentinel-3B and will be adjusted later.

Editing criteria are used to select valid measurements over ocean. The editing process is divided into 3 parts as described below:

1/ Editing by flags:

A first step is to select the points where the editing thresholds will be applied. The points where:

- the ice flag is 0 (Ocean) or 5 (not evaluated),
- and the surface_type flag is 0 (Open Sea or Semi-enclosed sea) or 1 (enclosed sea or lake)
- only for NRT: the orbit source has to be ROE or Doris

are taken into account.
2/ Editing with parameters thresholds:

The editing criteria are defined as minimum and maximum thresholds for altimeter, radiometer and geophysical parameters (Table 3). They are expected to remain constant throughout the mission, so that monitoring the number of edited measurements allows an observation of data quality. Measurements are edited if at least one of the parameters does not lie within those thresholds.

</tbody>
</table>

Table 2. Editing thresholds for each parameter for NTC, NRT and STC timeliness
3/ Editing by statistical validation on the track for NRT/STC data:
A final editing is used in order eliminate the tracks where orbit error can be very high:
For a track with a minimum of 200 points where:
• the bathymetry < -1000m,
• the oceanic variability < 0.1m,
• the distance to the coast > 10km,
• the latitude is < 66°.
Then the track is eliminated if one of these criteria is true:
• the mean of Sea Level Anomaly of all the points > 0.15m,
• the standard deviation of the Sea Level Anomaly of all the points > 0.2m.

4/ Iterative editing of sea level anomaly for NTC data:
Data are edited with a median filter, taking into account the ocean variability.
\[ |R| > 3 \left[ \sigma (R) + \sigma (\text{MSLA}) \right] \]
Where:
\( R = \text{SLA} - \text{SLA low pass filtered at 500 km} \)
\( \sigma (\text{MSLA}) \) is the standard deviation of a mean ocean variability.
3.5. Product Generation

The ‘Sea Level Anomalies’ as described in section 2.1 are computed with the corrections given in Table3.

In order to allow the user to compute himself its own ‘Sea Surface Height’ depending on his needs, the corrections used to compute the ‘Sea Level Anomalies’ are present in the output product (see Table 5 for details about the names of variables). This allows computing the raw ‘Sea Surface Height’

Each product will contain one file per pass. The files are zipped (*.gz). The files are delivered in cycles folders for L2P NTC products. The following table gives the frequency of delivery and the number of files delivered.

<table>
<thead>
<tr>
<th>L2P altimetry output product</th>
<th>Frequency</th>
<th>Number of files delivered</th>
</tr>
</thead>
<tbody>
<tr>
<td>Near Real Time (NRT)</td>
<td>Several times a day</td>
<td>28 passes per day (as soon as a L2 file is available, it is produced into a L2P pass file and delivered to ftp. Only the most complete L2P pass file for each pass is kept, the less complete L2P files are removed from ftp)</td>
</tr>
<tr>
<td>Short Time Critical (STC)</td>
<td>Several times per day</td>
<td>28 passes net per day (note that generally two L2P STC files (a first very short, later the complete file) are produced for even passes, as the pass splitting in high northern latitudes is slightly different between L2 and L2P data, but only the more complete L2P pass file will be kept on ftp)</td>
</tr>
<tr>
<td>Non Time Critical (NTC)</td>
<td>Once per cycle (every 27 days)</td>

Table 4. Temporal availability of LP2 Sentinel-3A and Sentinel-3B products.

4.2. Nomenclature

The generic model of L2P filename is:

```
global_sla_l2p_<data_type>_<mission>_<cycle>_<pass>_<begin_date>_<end_date>_<production_date>.nc
```

The L2P products name components are:

- The type of data (NRT/STC/NTC): `<data_type>`
- The mission (s3a/s3b): `<mission>`
- The cycle/pass considered: `<cycle>_<pass>`
- The begin and end dates of the data: `<begin_date>_<end_date>`
- The production date: `<production_date>`

This is a filename example:

```
global_sla_l2p_nrt_s3a_C0006_P0407_20160713T031500_20160713T035759_20160902T175905.nc
```

In case of L2P reprocessing activities, the GLOBAL_SLA_L2P_NTC product will be available in two versions:

- The reference product
The reprocessed product

The nomenclature of these two products is the same, but a global attribute containing the version number within the L2P product allows distinguishing them. Furthermore the files will be available in distinct directories.
5. Data Format

This chapter presents the data storage format and convention used for S3 L2P products. All products are distributed in NetCDF with norm CF.

NetCDF (Network Common Data Form) is an open source, generic and multi-platform format developed by Unidata. An exhaustive presentation of NetCDF and additional conventions is available on the following web site:

All basic NetCDF conventions are applied to files.

Additionally the files are based on the attribute data tags defined by the Cooperative Ocean/Atmosphere Research Data Service (COARDS) and Climate Forecast (CF) metadata conventions. The CF convention generalises and extends the COARDS convention but relaxes the COARDS constraints on dimension and order and specifies methods for reducing the size of datasets. A wide range of software is available to write or read NetCDF/CF files. API made available by UNIDATA (http://www.unidata.ucar.edu/software/netcdf):

- C/C++/Fortran
- Java
- MATLAB, Objective-C, Perl, Python, R, Ruby, Tcl/Tk.
5.1. L2P Format

5.1.1. Dimensions
1 Dimension is defined:
- **time**: number of data in current file, sampled at 1Hz.

5.1.2. Data Handling Variables
You will find hereafter the definitions of the variables defined in the product:

<table>

Table 6. Mapping between variables in L2 and L2P files
6. Products accessibility

The Sentinel-3 L2P products are available via authenticated servers.

- On authenticated Aviso+ FTP (online products):

  A login /Password will be provided via email with all the necessary information to access the products.
  - Once you are registered, the access to the products is given in your personal MY AVISO+ account in the ‘product page’ available on: [https://www.aviso.altimetry.fr/no_cache/en/my-aviso-plus.html](https://www.aviso.altimetry.fr/no_cache/en/my-aviso-plus.html)

- On the authenticated Aviso+ CNES Data Center (archived products):
  Register and download on [https://aviso-data-center.cnrs.fr/](https://aviso-data-center.cnrs.fr/)

Citation:

Please refer to the licence agreement to mention credits explicitly in function of your use (section 13. Licence specific to Sentinel-3 L2P products).
7. News, updates and reprocessing

7.1. Operational news

To be kept informed about events occurring on the satellites and on the potential services interruption, see the [Duacs] operational news on the Aviso+ website: http://www.aviso.altimetry.fr/en/data/operational-news/index.html.

7.2. Updates and reprocessing

July 2020: The L2P sea level NRT/STC products switch to product version 02_10 (including internal tides).

February 2019: A new NTC L2P S3A version (02_01) is available on the ftp server. It takes into account the “spring 2018 reprocessed” version of input NTC L2 products fully detailed in the following document:

January 2019: The Sentinel-3B L2P data are available on the ftp server in NRT, STC and NTC timeliness.

November 2017: A new NTC L2P S3A version (02_00) is available on the ftp server. It takes into account the “spring 2017 reprocessed” version of input NTC L2 products fully detailed in the following document:

An Aviso+ web page is dedicated to updates and reprocessing of mono-mission products such as L2P products:

7.3. Versions of upstream L2 data used in L2P processing

Since 6 July 2020 the L2P NRT and STC are processed in product version 02_10 (see table 2 for standards used). They are based on L2 NRT and STC products processed with processing baselines 2.61 onwards.

Previously, the L2P NRT and STC were processed in product version 01_01 (see Table 8 for standards used). They were based on L2 NRT and STC products processed with processing baselines 2.09 onwards.

The current product version of the L2P S3A NTC data is 02_01. It is based on L2 NTC from spring 2018 reprocessing (PB 2.27) and further processing baselines.

The current product version of the L2P S3B NTC data is 02_00. It is based on L2 NTC from processing baselines 1.13 and onwards).

Figure 3 shows an overview of the L2 processing baseline versions used in the S3A L2P processing. Information about the content of the different L2 processing baselines can be found at:
Table 7 gives some information about the L2P NTC versions.

Figure 3 Overview of the L2 processing baseline versions used in the L2P processing.
### 7.4. Standards used for L2P processing

Hereafter past and current standards used are listed. For information which L2P product version uses which standards please refer to Table 7. Erreur ! Source du renvoi introuvable.. Note that evolution of standards (especially for NTC products) occur generally prior to CMEMS L3 reprocessing activities, as L2P products are input data for L3 products.

#### 7.4.1. Standards equivalent CMEMS 2018 processing

In the latest version of Sentinel-3A and Sentinel-3B L2P products, the reference ellipsoid has been updated to take into account the non-spherical shape of Earth, following the TOPEX/Poseidon and Jason series standards. The new ellipsoid includes:

- Equatorial radius of 6378.1363 kilometers
- Flattening coefficient of 1/298.257

This change affects the relationship between ground and satellite observations, particularly in the context of atmospheric and oceanographic corrections.
